We present the current status of observation and analysis of AGNs by the CANGAROO-II team. Since June 1999 we have observed several southern AGNs, including PKS0548-322, PKS2005-489 and PKS2155-304, with the CANGAROO-II telescope. During this time the telescope, which was initially a 7 m dish, was expanded to its full 10 m diameter. The targeted AGN are all HBLs and they remained in a low level state during our observations. The total AGN observing time is about 170 hours for both ON-source and OFF-source scans. No statistically significant excess was found and we set flux upper limits. We will show the results and discuss their implications.
