Model analysis for the MAGIC telescope

The MAGIC Collaboration operates the 17m imaging Cherenkov telescope on the Canary island La Palma. The main goal of the experiment is an energy threshold below 100 GeV for primary gamma rays. The new analysis technique (model analysis) takes advantage of the high resolution (both in space and time) camera by fitting the averaged expected templates of the shower development to the measured shower images in the camera. This approach allows to recognize and reconstruct images just above the level of the night sky background light fluctuations. Progress and preliminary results of the model analysis technique will be presented.

Primary authors : Mr. MAZIN, Daniel (Max-Planck-Institute for Physics, Munich)

Co-authors : Dr. BIGONGIARI, Ciro (Università di Padova and INFN sez. di Padova) ; Dr. GOEBEL, Florian (Max-Planck-Institute for Physics, Munich) ; Dr. WITTEK, Wolfgang (Max-Planck-Institute for Physics, Munich)

Presenter : Mr. MAZIN, Daniel (Max-Planck-Institute for Physics, Munich)

Session classification : Posters 3 + Coffee

Track classification : HE.2.1

Type : Poster
