

# TRD Software Status – Reconstruction / Simulation

Mark Millinger  
Physikalisches Institut Ib  
RWTH Aachen University

# Testbeam data spectra

- Cherenkov signals added to AMS trigger as ExtGate1/2
- Disregarding EG selection (pion = EG0&&EG1) improves agreement on proton / pion spectra (same gamma factor)

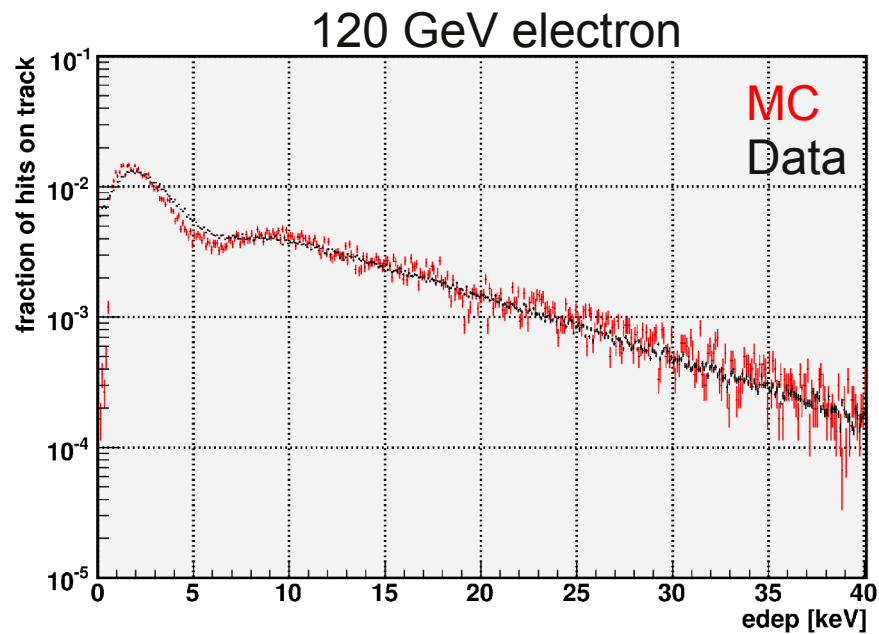

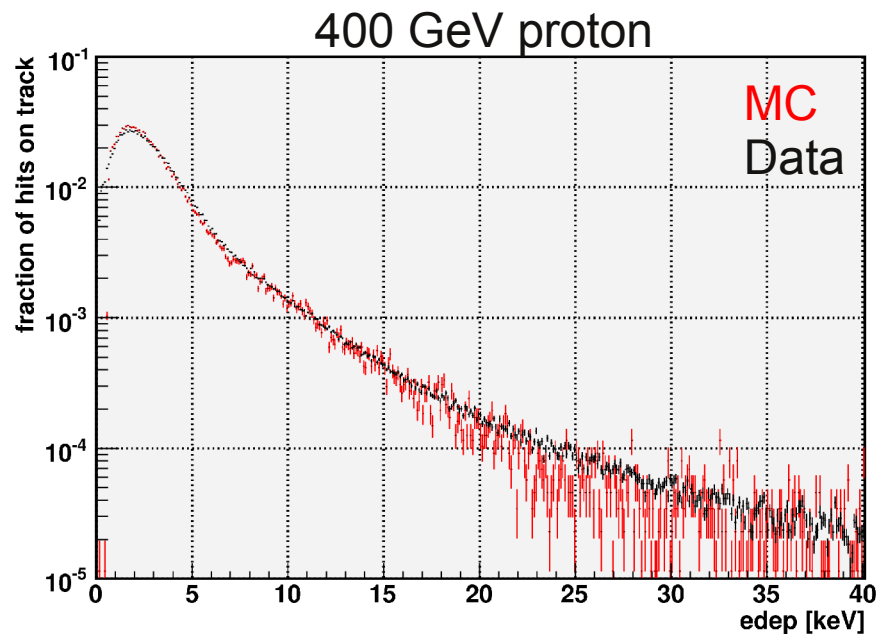

# Gbatch Software Updates

---

- **ParticleR class:**
  - Simple / Robust Cluster Counting algorithm
  - Updated PDFs – independent of other subdetectors (rigidity)
  - “Single” likelihoods for events being proton- / electron-like
- **Geant3 Simulation**
  - Introduced factors to tune TR Generation / Absorption & Ionization
- **Geant4 Simulation**
  - Updated Makefile (source g4i – make -f Moptg4)
  - Workaround for bug in TRD geometry

# Testbeam / MC spectra

- Energy deposition fairly described by AMS Geant3 MC
- Better performance expected from Geant4

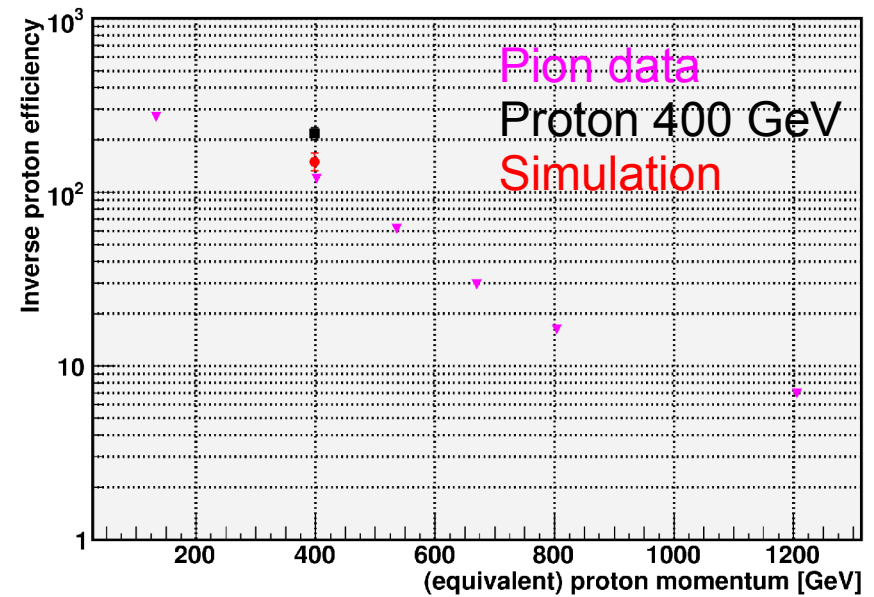

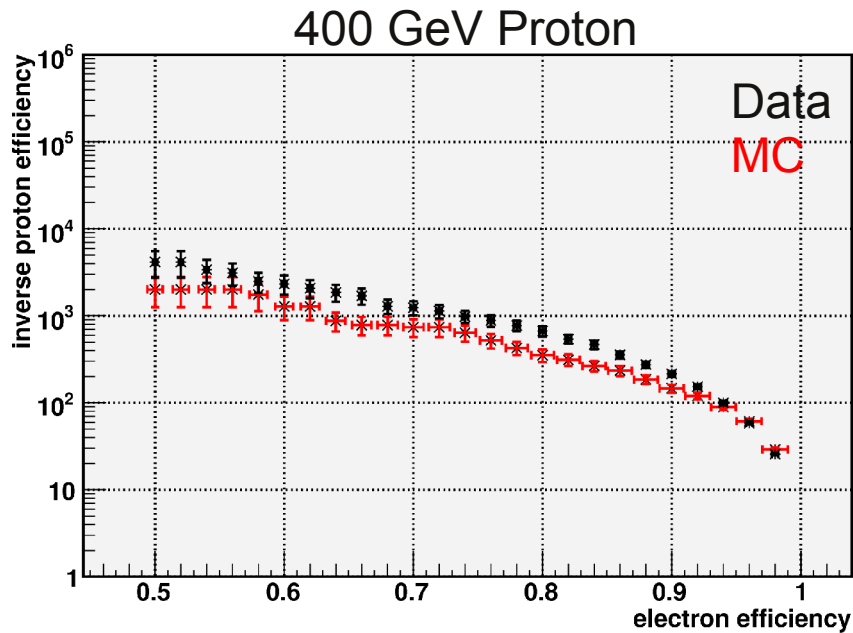

# Geant4 advantages

---

- Maintained / Up-to-date Detector Simulation package
- Modular Physics Processes (Various models)
- **For TRD:**
  - TR photon physics is calculated for materials rather than added by hand / parametrized in physics tables
  - Ionization processes in thin layers are calculated for tube gas
  - Calculation above based on material parameters (e.g. density, temperature, pressure, composition of TRD gas)

# TRD identification performance

- Inverse proton efficiency above 100 up to at least 400 GeV
- MC reasonably matches testbeam results
  - Deviation could arise from 400 GeV “Microbeam”

# Things to be done

---

- **Reconstruction / Analysis**

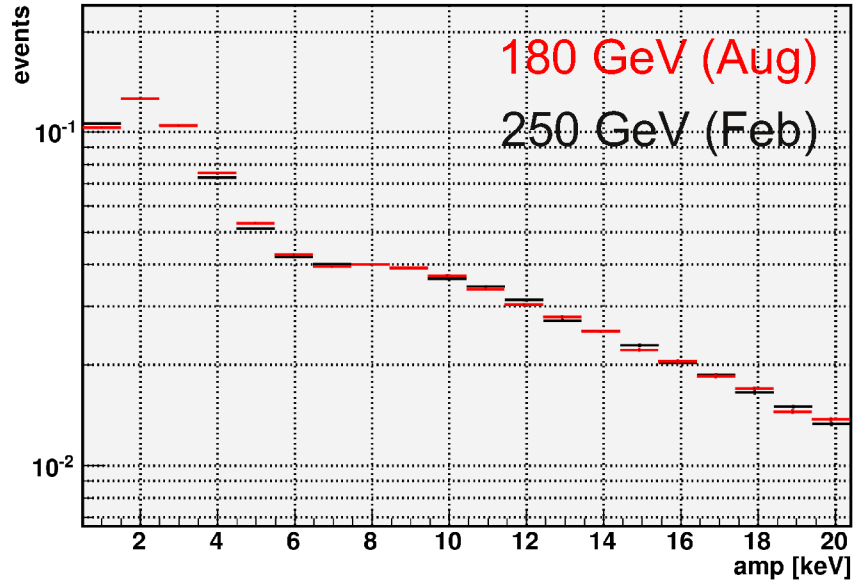

- Verification of updated particle identification (ParticleR)
- Calibration of TRD
- Angular scan of tube spectra and particle efficiencies (Testbeam)
- Charge reconstruction in TRD

- **Simulation code**

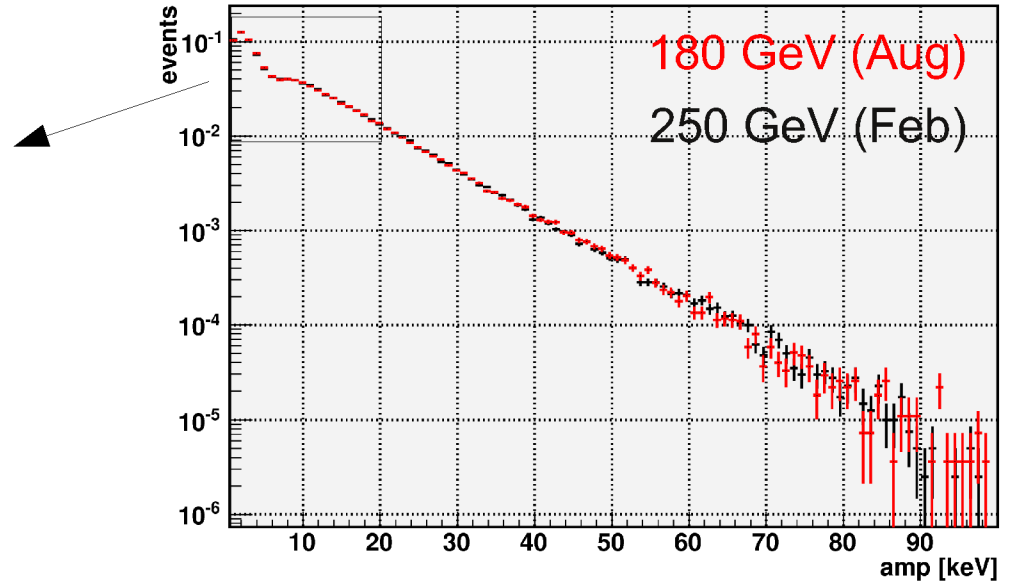

- Verification of Geant3 MC
- Code update and verification for Geant4 MC
