Kinetic Energy Spectra :  
background and reconstruction efficiency estimation

May 17, 2006

AMS-unige meeting

## Averaged kinetic energy spectra

$$\bar{F}(E_k, \cos\Theta_m, \Phi_m) = \frac{\sum N(E_k, \cos\Theta_m, \Phi_m)}{\varepsilon \Delta t(\cos\Theta_m, \Phi_m)}$$

Kinetic Energy:  $E_k \Rightarrow \Delta E_k$

Geomagnetic Latitude and Longitude:  $\Theta_m, \Phi_m \Rightarrow \Delta\Theta_m, \Delta\Phi_m$

Number of particles with Kinetic Energy  $E_k$  in range  $(\cos\Theta_m, \Phi_m)$ :  $N$

Lifetime in range  $(\cos\Theta_m, \Phi_m)$ :  $\Delta t(\cos\Theta_m, \Phi_m) \Rightarrow \Delta t(\Delta|\Theta_m|, \Delta\Phi_m)$

Acceptance:  $\varepsilon$

## Background & Reconstruction Efficiency estimation

Number of particles with Kinetic Energy  $E_k$  :

$$N(E_k) = \frac{N_{rec\ as\ i}^{DATA} - b_i}{\epsilon_i} \quad i = He, p, e^-$$

Background :  $b_i$  due to particle's misidentification :

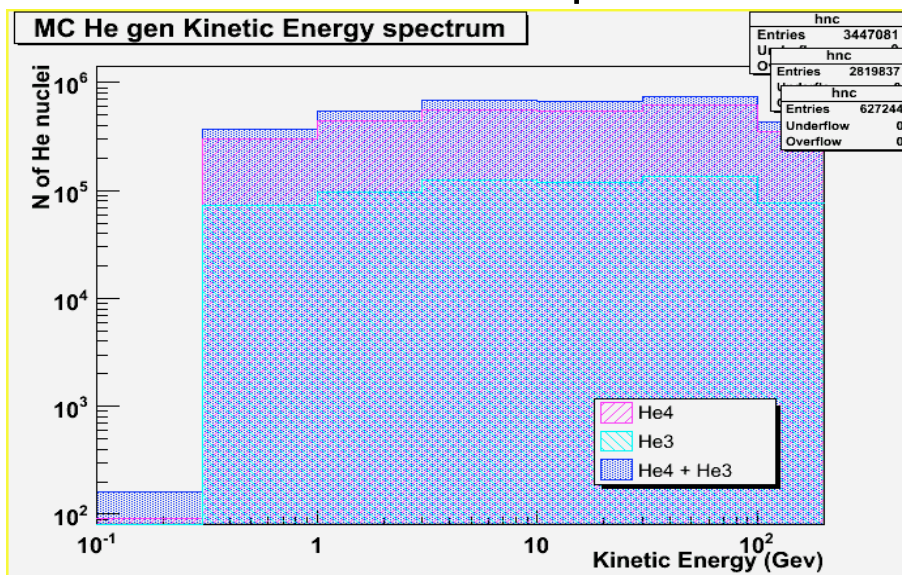

$$b_i(E_k) \approx \sum_{\substack{j=He, p, e^- \\ j \neq i}} \frac{\epsilon_{ij}}{\epsilon_{jj}} N_{rec\ as\ j}^{DATA}(E_k) \quad \text{with} \quad \epsilon_{ij} = \frac{N_{rec\ as\ i}^{MC}(E_k)}{N_{gen\ as\ j}^{MC}(E_k)}$$

$$\text{Reconstruction efficiency: } \epsilon_i = \epsilon_{ii} = \frac{N_{rec\ as\ i}^{MC}(E_k)}{N_{gen\ as\ i}^{MC}(E_k)}$$

## He MC sample

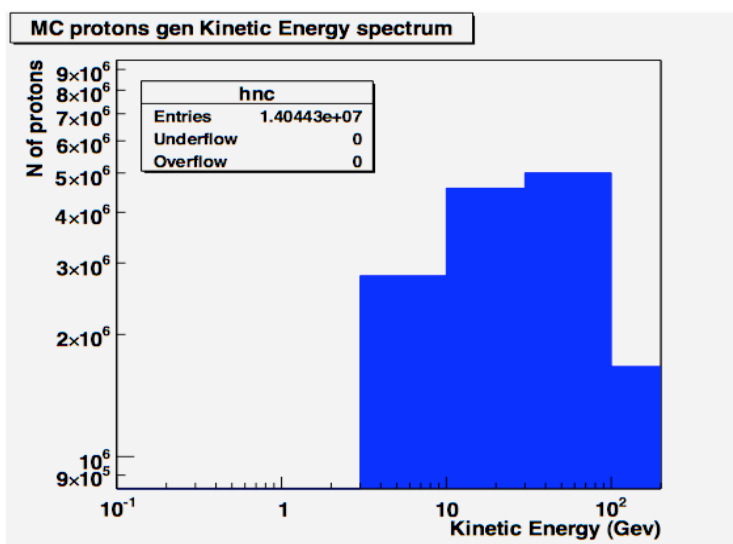

May 17, 2006

AMS-unige meeting

# Protons MC sample

p<sub>gen</sub> 6 GeV -> 150 GeV

May 17, 2006

AMS-unige meeting

# Electrons MC sample

p<sub>gen</sub> 1 GeV -> 60 GeV

May 17, 2006

AMS-unige meeting

# MC selection

Selection cuts on generated He nuclei to fulfil geometrical pattern required in DATA selection:

✓ No MC hits in Anticoincidence counter

⇒ No hits in Anticoincidence counter

✓ At least 4 hit planes in Tracker

⇒ To make advanced fit possible

⇒ Number of True Tracker K clusters  $\geq 3$

✓ At least 3 hit planes in TOF

⇒ Number of TOF planes  $\geq 3$

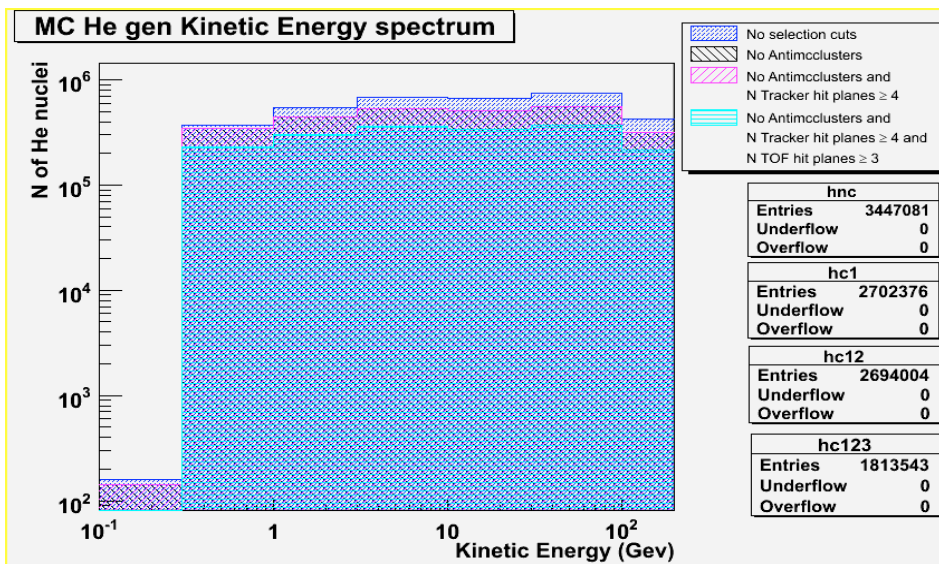

▪ MC cuts ( $\Rightarrow$  gen cuts)

▪ DATA cuts/requirements
