						<b>SCALAR BOSONS</b>
						<b>GAUGE BOSONS</b>

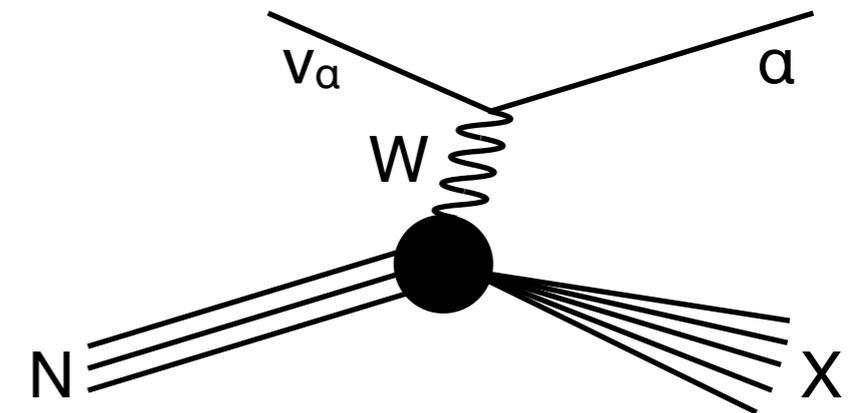

Classical Standard Model states:

- Neutrinos are massless
- Lepton flavour is conserved

# Flavour and cross section

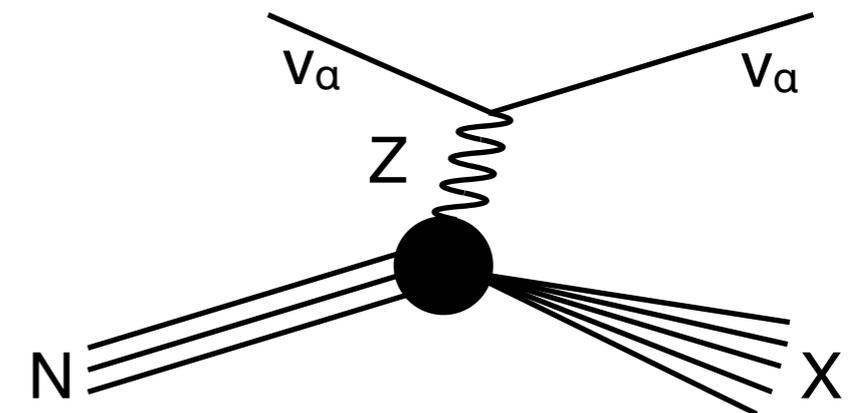

## Charged current interactions (CC).

The flavour  $\nu_\alpha$  of the neutrino defined by the charged lepton  $\alpha$ .

## Neutral current interactions (NC).

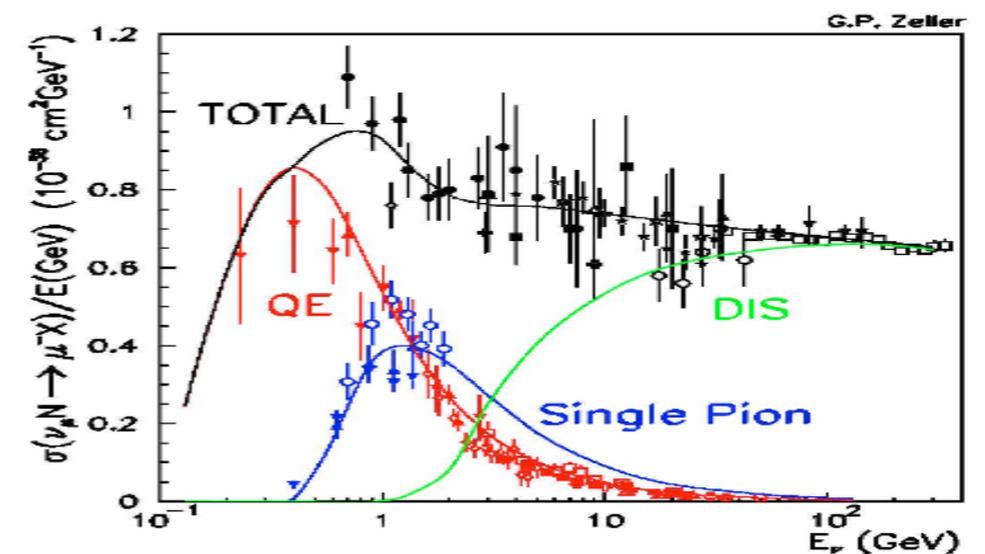

The flavour of the neutrino cannot be determined.

## Weakly interacting.

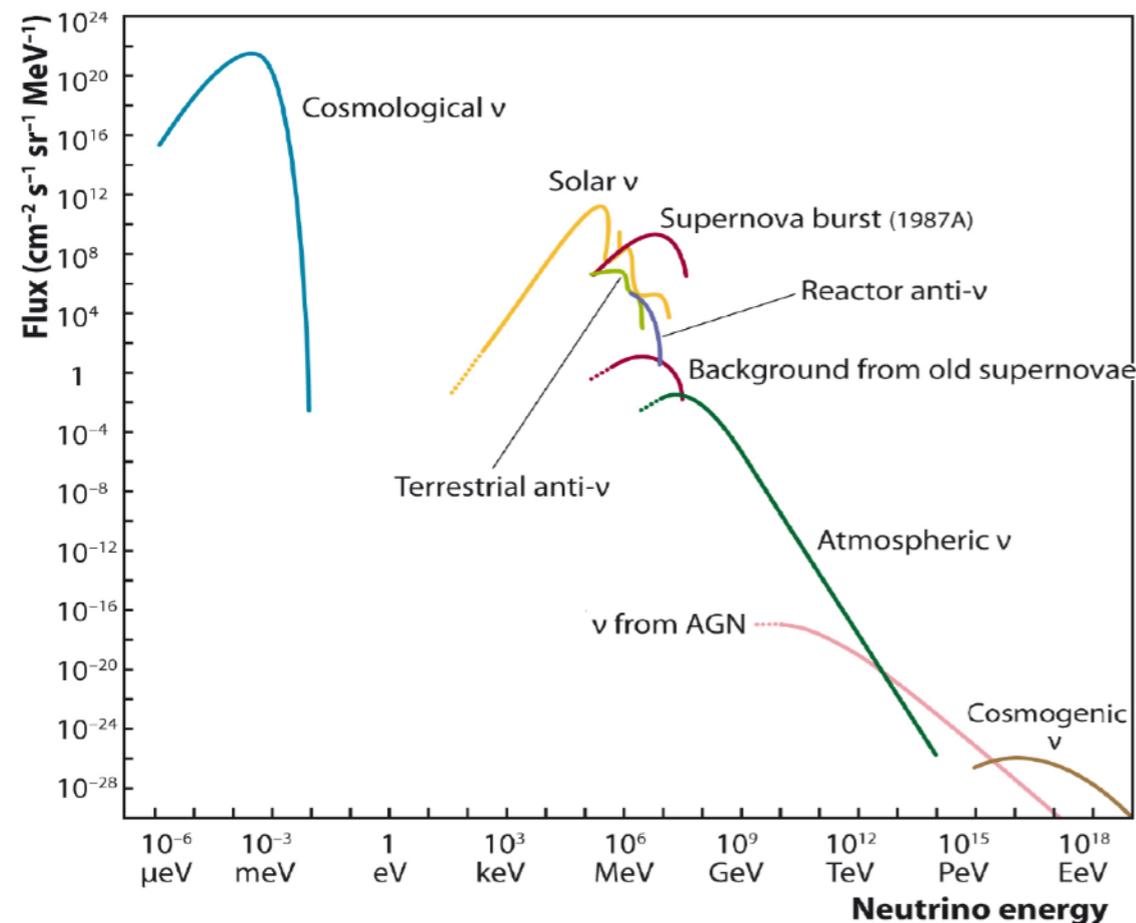

Very light and interacting only weakly ( $\sigma_{\nu \rightarrow N}/E_\nu \approx 10^{-38} \text{ cm}^2/\text{GeV}$ ).

1 GeV neutrino mean free path in lead  $\approx 10^{11} \text{ m}$ .

# Neutrino sources

## Natural

## Artificial:

- Fission reactors O(MeV)
- Standard accelerators O(GeV)
- Radioactive sources
- *Neutrino factories*
- *Beta beams*

Katz, U.F. et al. Prog.Part.Nucl.Phys. 67 (2012) 651

# History

1930 - Pauli postulates the existence of neutrino (called neutron)

“I have done a terrible thing, I have postulated a particle that cannot be detected”

W. Pauli 1930

1932 - Chadwick discovers the neutron

1933/4 - Fermi proposes the name neutrino and publishes the beta decay theory

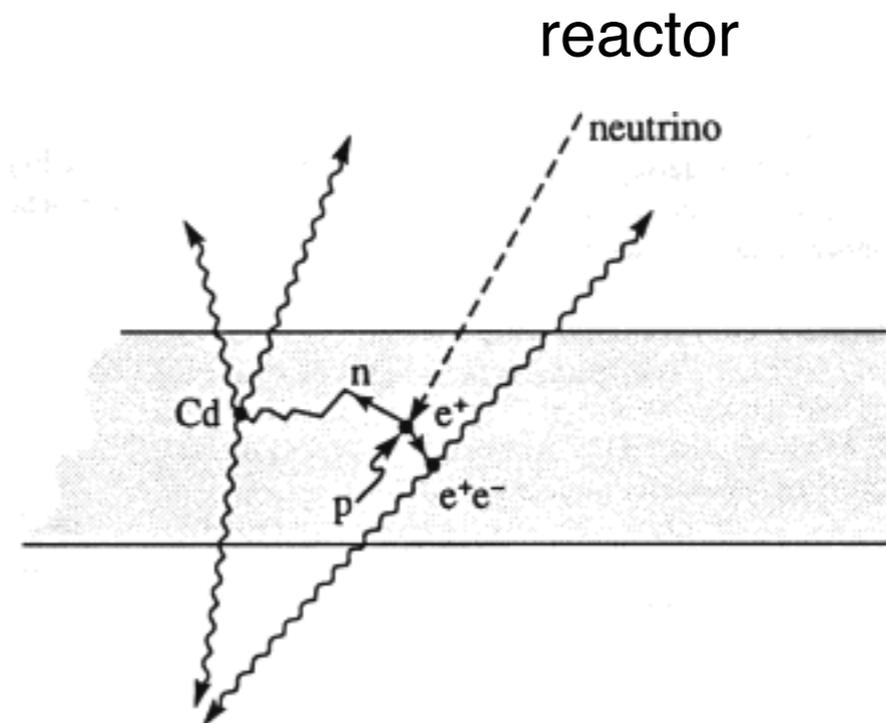

1956 - Cowan and Reines discover the (electron anti-)neutrinos

Cowan - Reines

$\text{anti-}\nu_e + p \rightarrow n + e^+$

$n + {}^{108}\text{Cd} \rightarrow {}^{109}\text{Cd} + \gamma$

$e^+ + e^- \rightarrow 2\gamma$

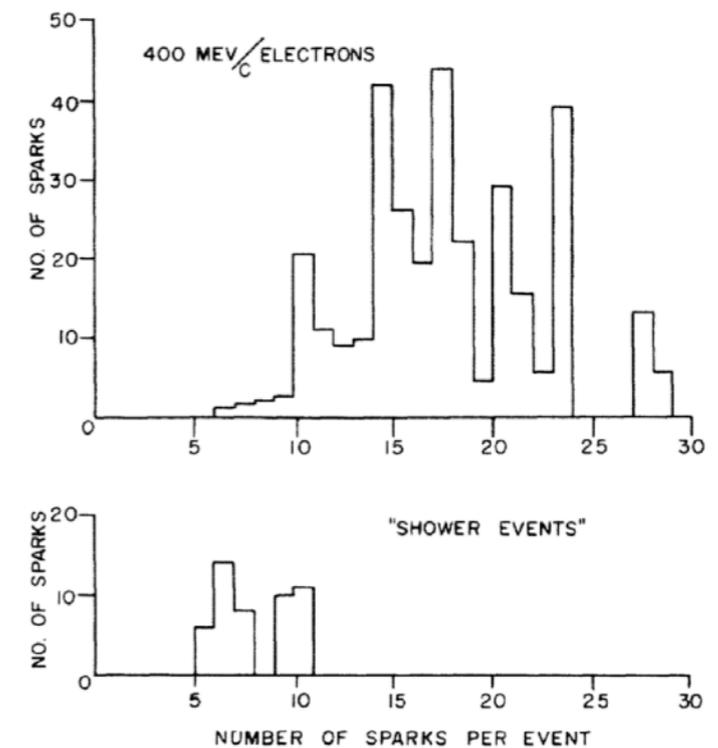

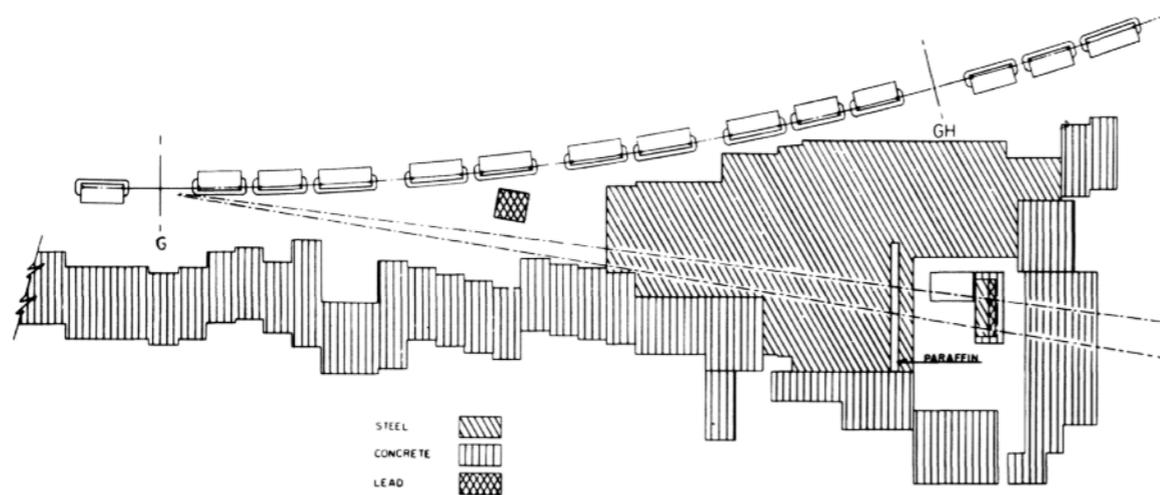

# History

1959 Pontecorvo suggests the existence of two types of neutrinos

1962 Lederman, Schwartz and Steinberger discover muon neutrinos

p accelerator  
AGS at BNL

$$\theta_{13} \sim 45^\circ$$

$$\theta_{12} \sim 9^\circ$$

$$\Delta m_{12}^2 \sim 7.5 \times 10^{-5} \text{ eV}^2$$

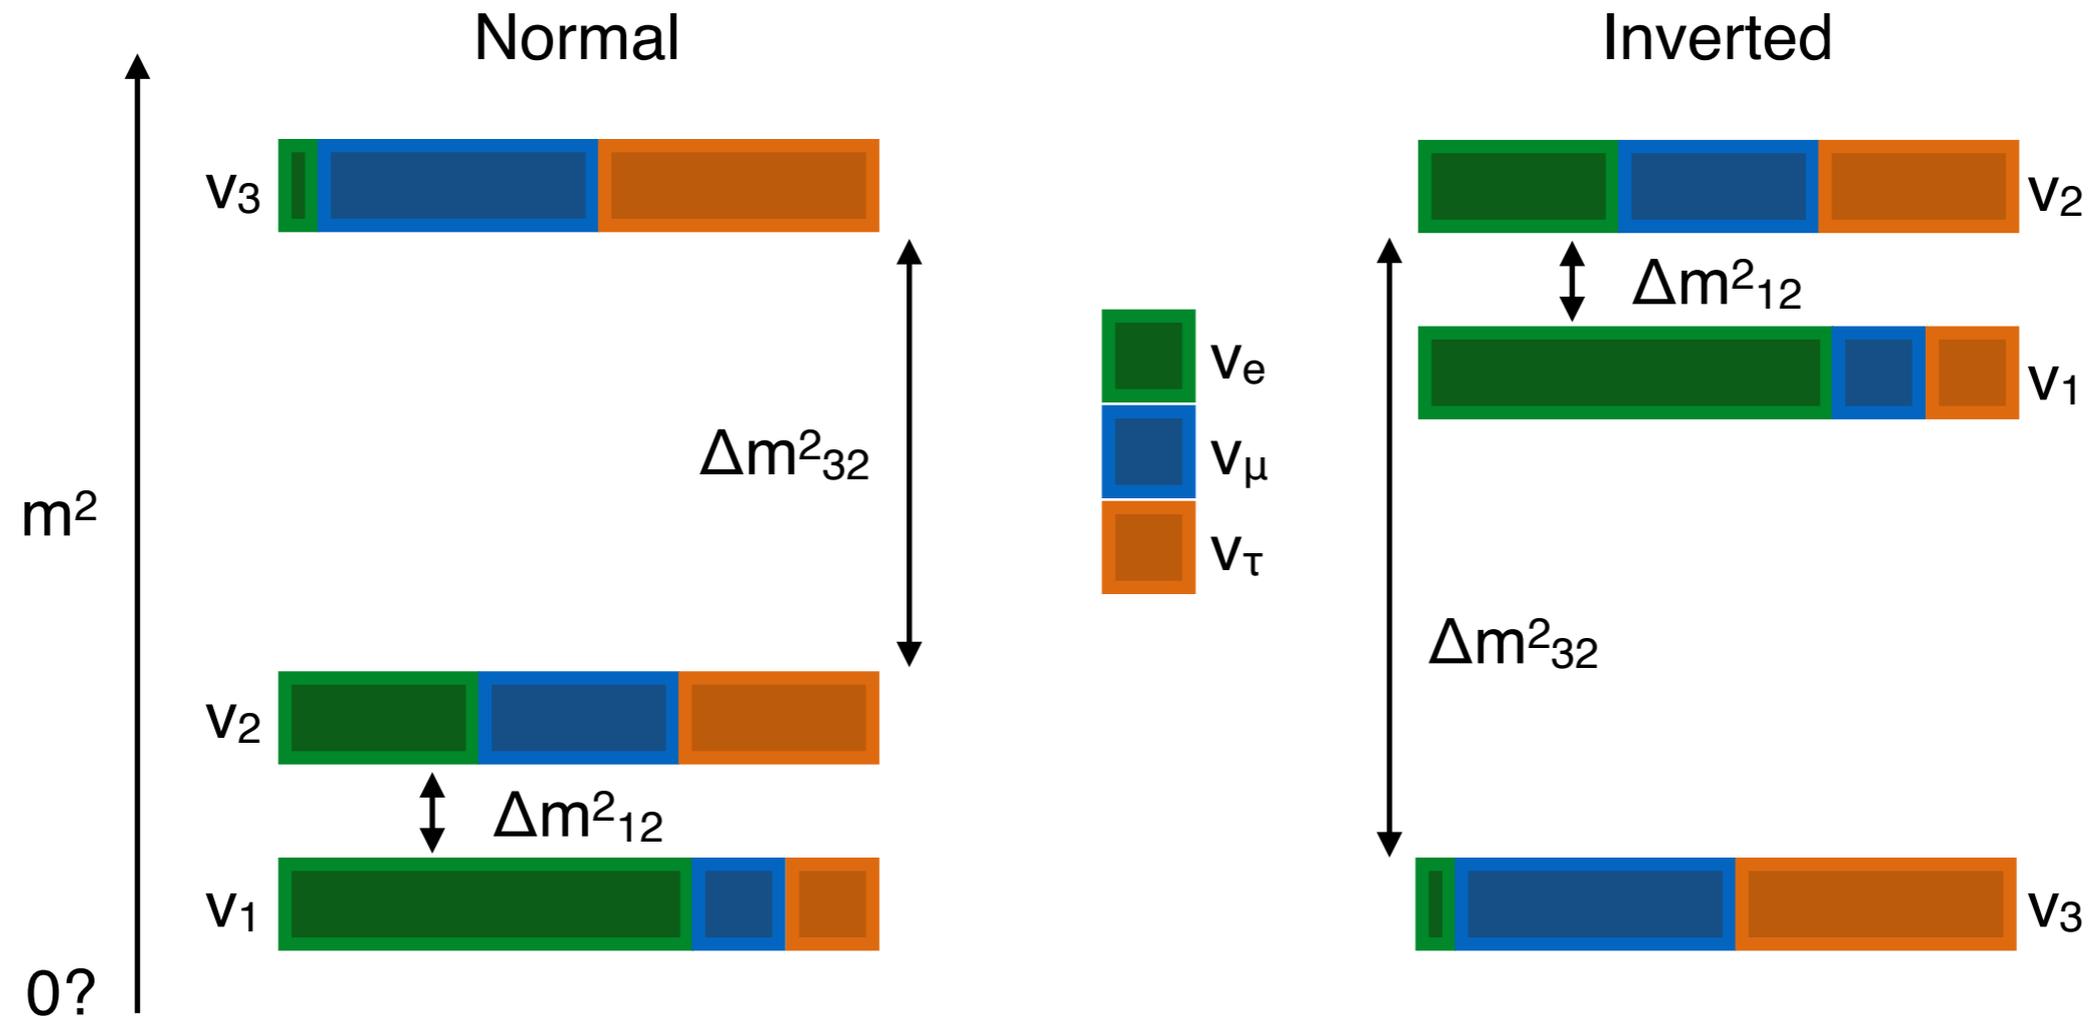

$$|\Delta m_{13}^2| \sim 2.4 \times 10^{-3} \text{ eV}^2$$

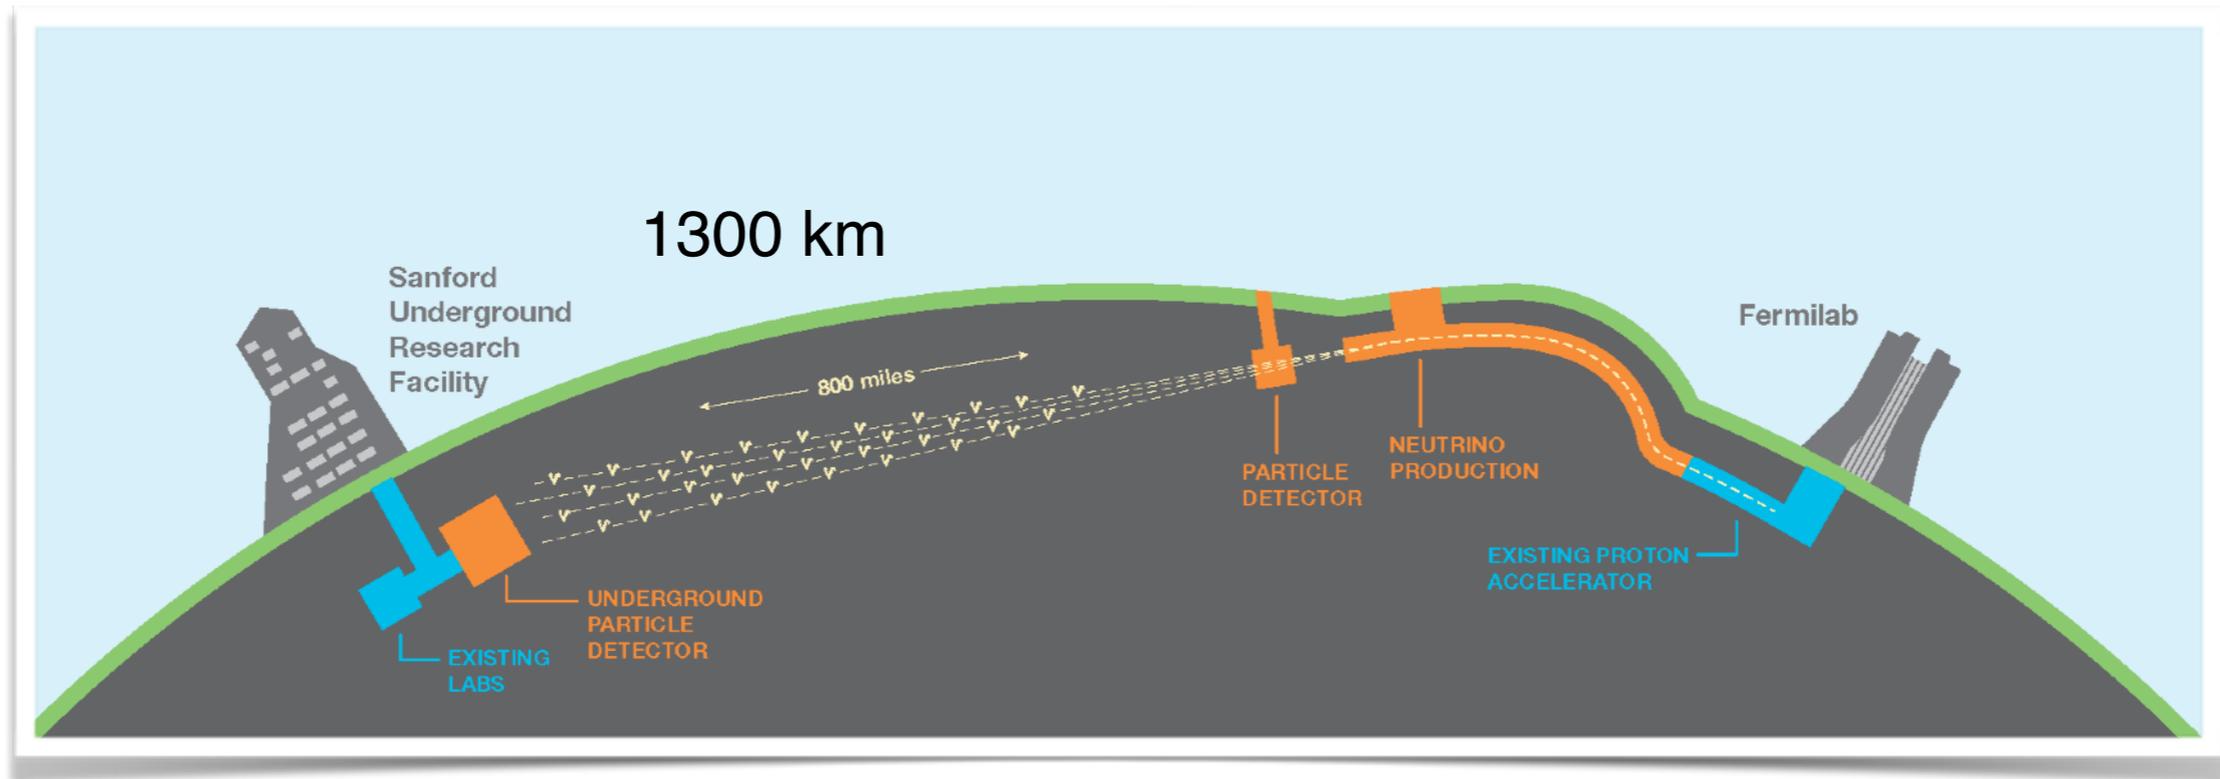

# Open questions

Unknowns:

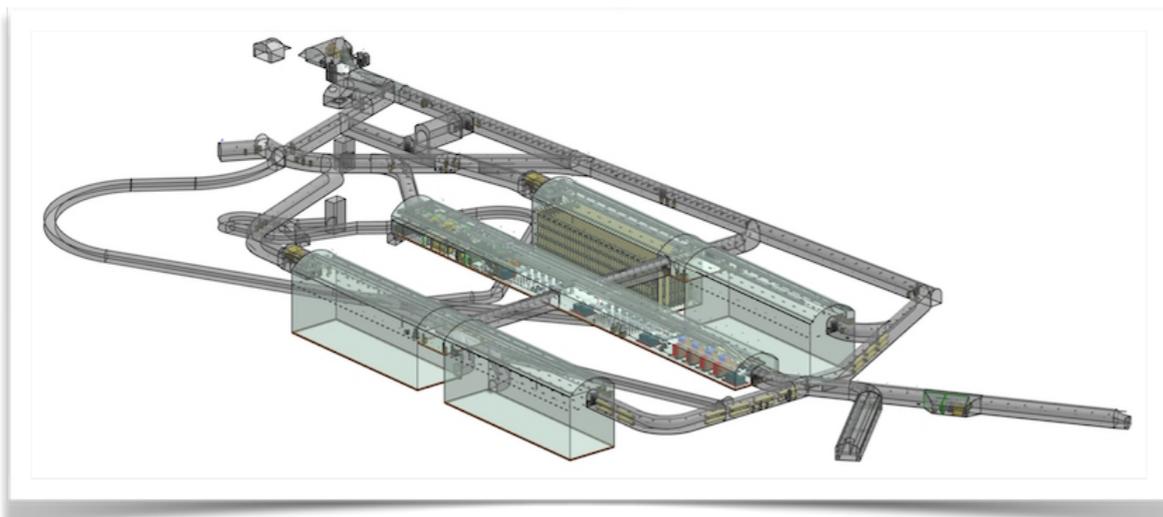

- $\delta_{cp}$ , neutrinos and anti-neutrinos behave differently? LB
- mass hierarchy (sign of  $\Delta m^2_{32}$ ), LB
- absolute mass scale,
- Dirac/Majorana,  $\nu_L = \text{anti-}\nu_R$ ?
- sterile neutrino, forth (or more) generation(s)? SB

# LBNF/DUNE

1500 m underground facility

- LBNF is the facility, DUNE is the experiment
- World most intense neutrino beam (wide energy)
  - 4 x 10 kton active mass underground LAr TPCs

Goals:

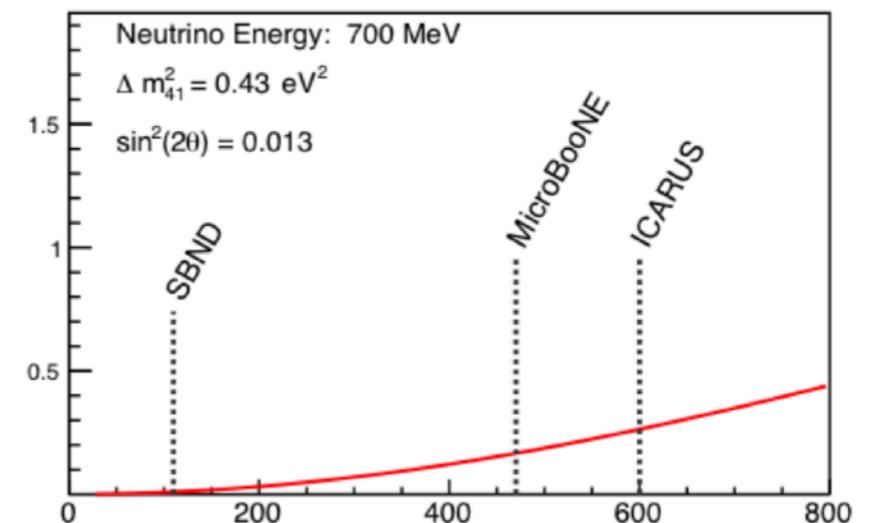

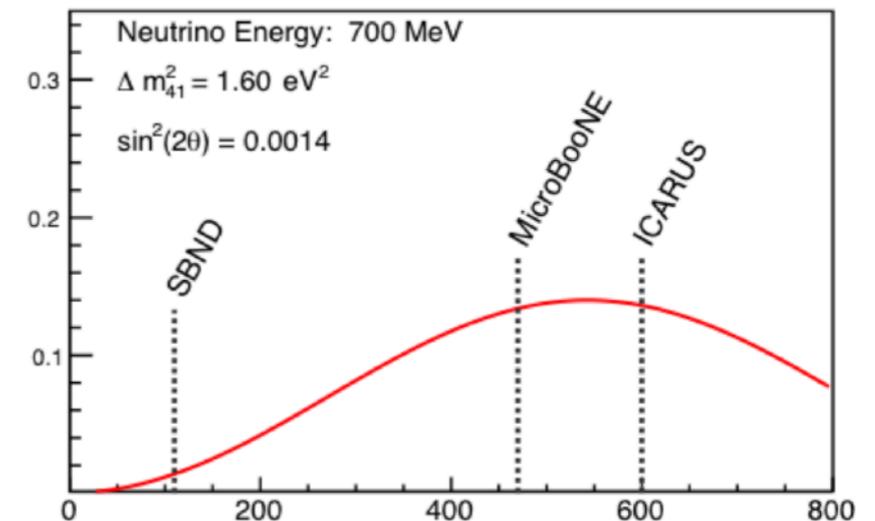

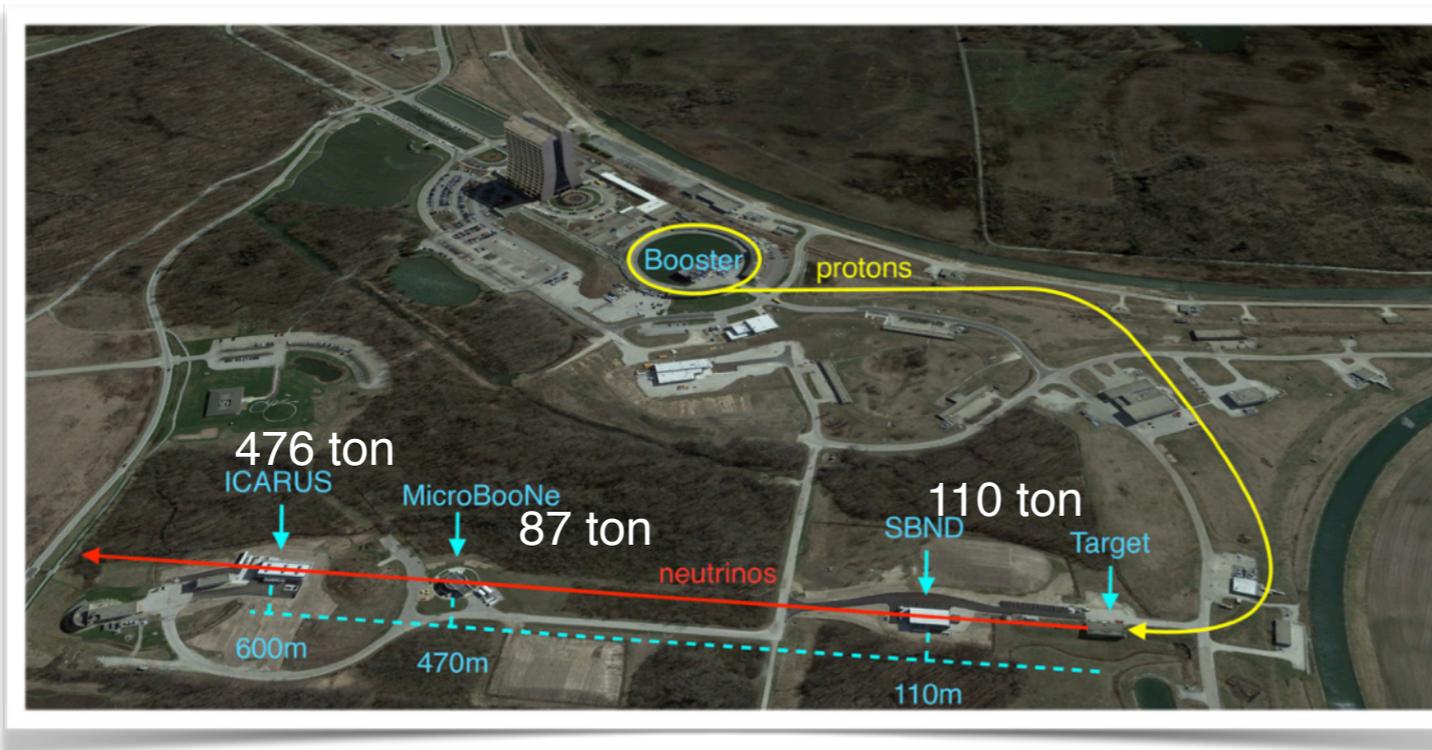

- neutrino mass hierarchy through MSW effect
- $\delta_{cp}$  from oscillation pattern and  $\nu/\text{anti-}\nu$
- proton decay search
- neutrino from supernovae

# SBN program

A physics program with 3 LAr TPCs in the Fermilab Booster Neutrino Beam:

- Explore neutrino oscillations beyond three-neutrino mixing
- Search for eV mass-scale sterile neutrinos in both appearance and disappearance channels
- Resolve the LSND and MiniBooNE anomalies
- Measure  $\nu$ -Ar cross-sections in the sub-GeV to few-GeV region
- Further advance LAr TPC technology and build up experience relevant for the (LBNF/DUNE)

three baselines -> redundancy and oscillation pattern  
 same target -> minimise cross section systematics  
 same technology -> minimise detector systematics

# 2013 European Strategy

## High-priority large-scale scientific activities

“Rapid progress in neutrino oscillation physics, with significant European involvement, has established a strong scientific case for a long-baseline neutrino programme exploring CP violation and the mass hierarchy in the neutrino sector. ***CERN should develop a neutrino programme to pave the way for a substantial European role in future long-baseline experiments. Europe should explore the possibility of major participation in leading long-baseline neutrino projects in the US and Japan.***”

# 2013 European Strategy

In other words:

- No neutrino beam at CERN
- Neutrino beam in US and Japan (maybe also in EU ESS?)
- A structure at CERN to foster an active involvement of Europe and CERN in the US and Japanese new programs

This led to the establishment of the **CERN Neutrino Platform** part of the CERN Medium Term Plan since 2015

# NP mandate

- **Assist** the various groups in their R&D phase in the short and medium term and give **coherence** to a fragmented European Neutrino Community
- Provide a charged particle test beam **infrastructure** for tests and R&D
- Bring R&D programs to the level of **technology demonstrators** in view of major construction activities
- Continue **neutrino beam** R&D, as possible basis for further collaborations
- Support the **short baseline** activities (infrastructure & detectors)
- Support the **long baselines** activities (infrastructure & detectors)
- Be a partner in the **physics exploitation**

# MoU framework

**Memorandum of Understanding** for providing a framework for developing a Neutrino Program at CERN  
<https://edms.cern.ch/document/1353815>

NP reacts on **input from the community**

As of October 2017, **106** institutes signed the MOU

CERN SPS Committee (SPSC) as an entry point

# NP participations

October 2017

# NP activities

Project already *approved* by the SPSC:

**NP01** (WA104): ICARUS detector as far detector for the SBN program in the US

**NP02** (WA105/ProtoDUNE-DP): R&D program, large size demonstrator and prototype on a charge particle beam of the double-phase LAr TPC technology

**NP04** (ProtoDUNE-SP): Large size engineering demonstrator and prototype on a charge particle beam of the single-phase LAr TPC technology

**NP05** (BabyMIND): Magnetised muon spectrometer for the WAGASCI experiment in Japan

**NP03** (Plafond): Generic R&D framework

In addition:

- Near detector studies for T2K and DUNE
- Performance study and requirement assessment of neutrino near detectors
- Participation in the design and construction of the DUNE cryostats
- Active participation in FNAL-SBN program
- Active participation in the DUNE program

# NP05 / BabyMIND

NP05 / BabyMIND Collaboration:

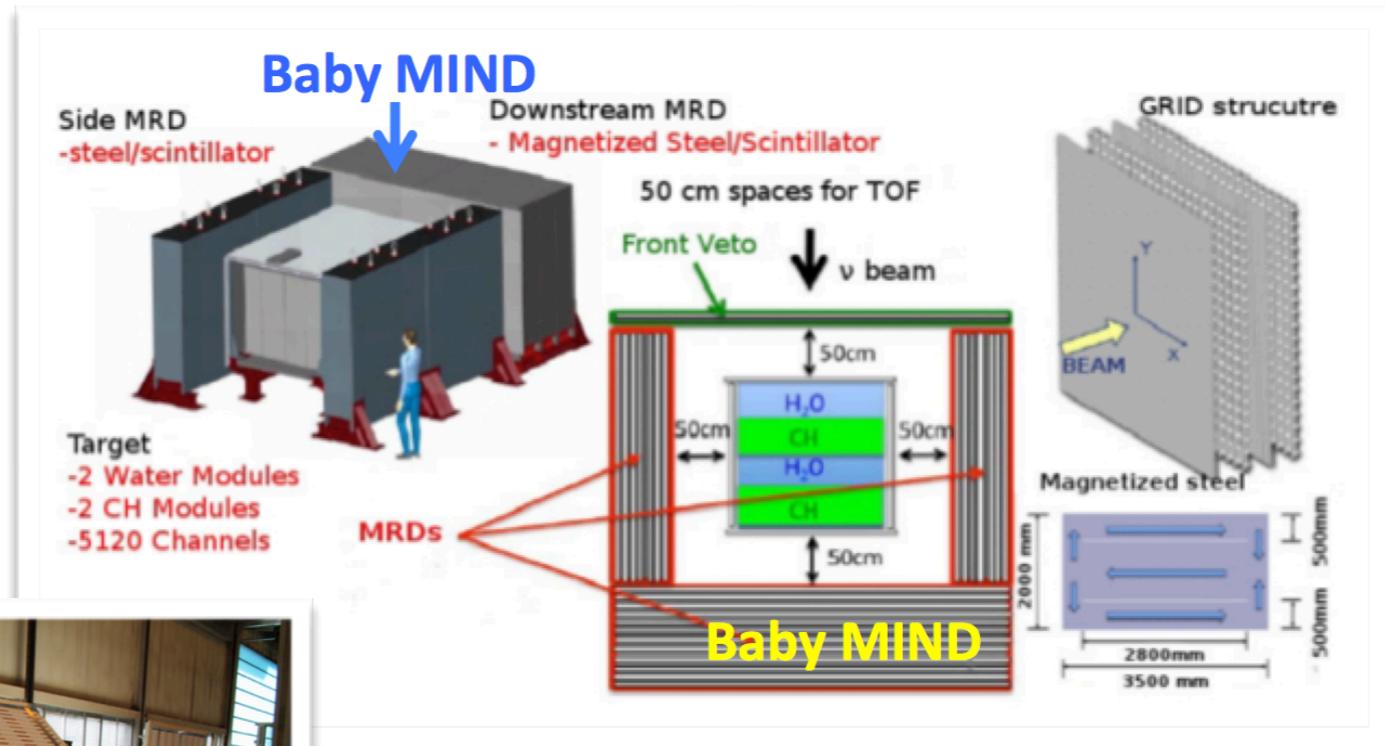

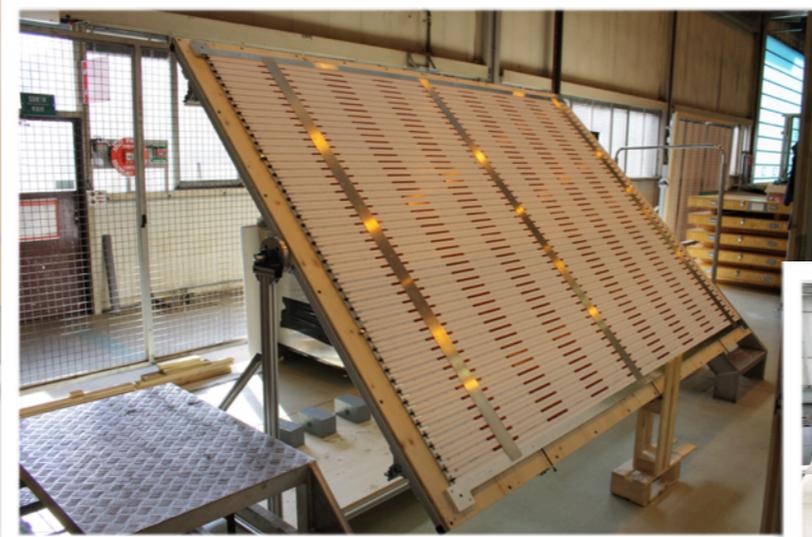

Instituto de Fisica Corpuscular (IFIC), Spain - Institute for Nuclear Research (INR),  
Russia - University of Geneva, Switzerland - University of Glasgow, United Kingdom -  
University of Sofia, Bulgaria - European Organisation for Nuclear Research (CERN),  
Switzerland

# NP05 / BabyMIND

Magnetised muon spectrometer for the WAGASCI experiment (T2K beam line)  
Interleaving of magnets (33) and scintillator (18) modules

Main systems:

- Magnet modules (CERN)
- Scintillator modules (JINR and UniGe)
- Readout electronics (UniGe and Sofia)
- Support mechanics (UniGe)

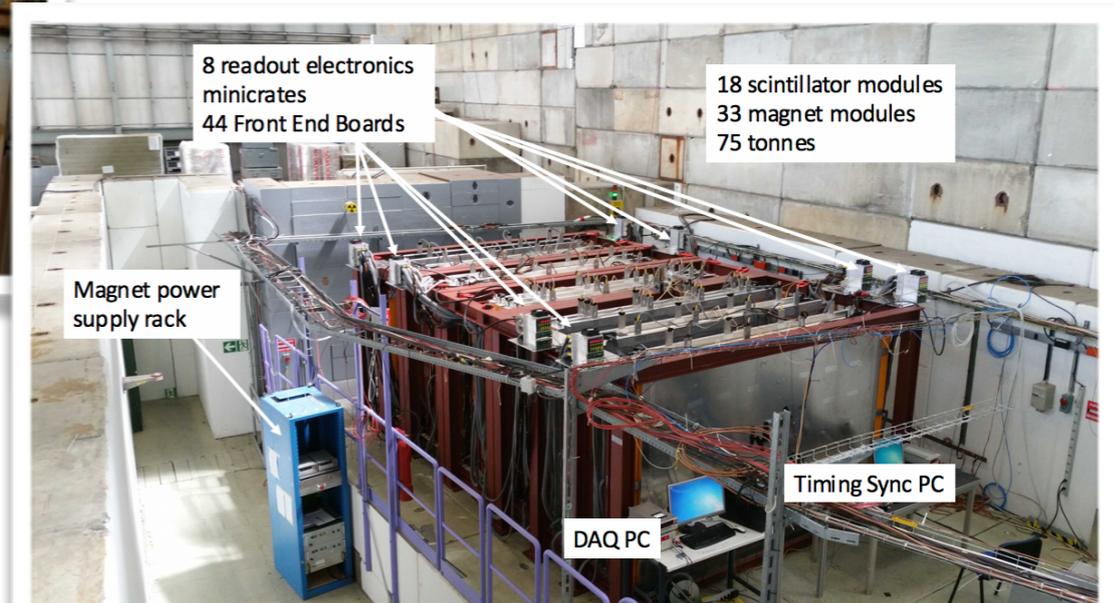

Baby MIND beam tests at PS in July 2017

Results recently presented at NuFact2017:

[https://indico.uu.se/event/324/session/6/](https://indico.uu.se/event/324/session/6/contribution/72/material/slides/0.pdf)

[contribution/72/material/slides/0.pdf](https://indico.uu.se/event/324/session/6/contribution/72/material/slides/0.pdf)

On its way to Japan

# NP01 / WA104

NP01 / WA104 Collaboration:

Argonne National Laboratory (ANL), USA - Brookhaven National Laboratory (BNL), USA - European Organisation for Nuclear Research (CERN), Switzerland - Colorado State University, USA - Fermi National Laboratory (FNAL), USA - INFN Catania and University Catania, Italy - INFN GSSI, Italy - INFN LNGS, Italy - INFN Milano and Milano Bicocca, Italy - INFN Napoli, Italy - INFN Padova and University, Italy - INFN Pavia and University, Italy - Los Alamos National Laboratory (LANL), USA - Pittsburgh University, USA - SLAC, USA - Texas University, USA

# NP01 / WA104

ICARUS T600 LAr TPCs successfully operated underground at LNGS on CNGS neutrino beam from 2009 to 2013.

Refurbish ICARUS T600 as far detector for the SBN program in the US (on surface at Fermilab):

- New cold (extruded aluminium) and warm (passive isolation) vessels
- Upgrade of light detection system (more sensitive, more coverage, new calibration system)
- Cabling and connectivity re-done (light and charge signals)
- Faster and higher performance electronics (FE, digitisation, DAQ systems)
- Refurbishing of the central cathode
- Design and construction (ongoing) of the top Cosmic Ray Tagger
- Proximity cryogenics re-design and presently in production.

These activities were conducted at CERN from December 2014 until June 2017  
Transport of the ICARUS modules to Fermilab from 12 June to 26 July 2017

# LAr TPC

Homogeneous calorimetric, 3D tracking and imaging device

Liquid argon as active medium:

- inert
- dense 1.4 kg/l
- not too expensive (1% of atmosphere)
- good scintillator in the VUV
- quasi-free electron able to drift
- Cryogenic, but simple

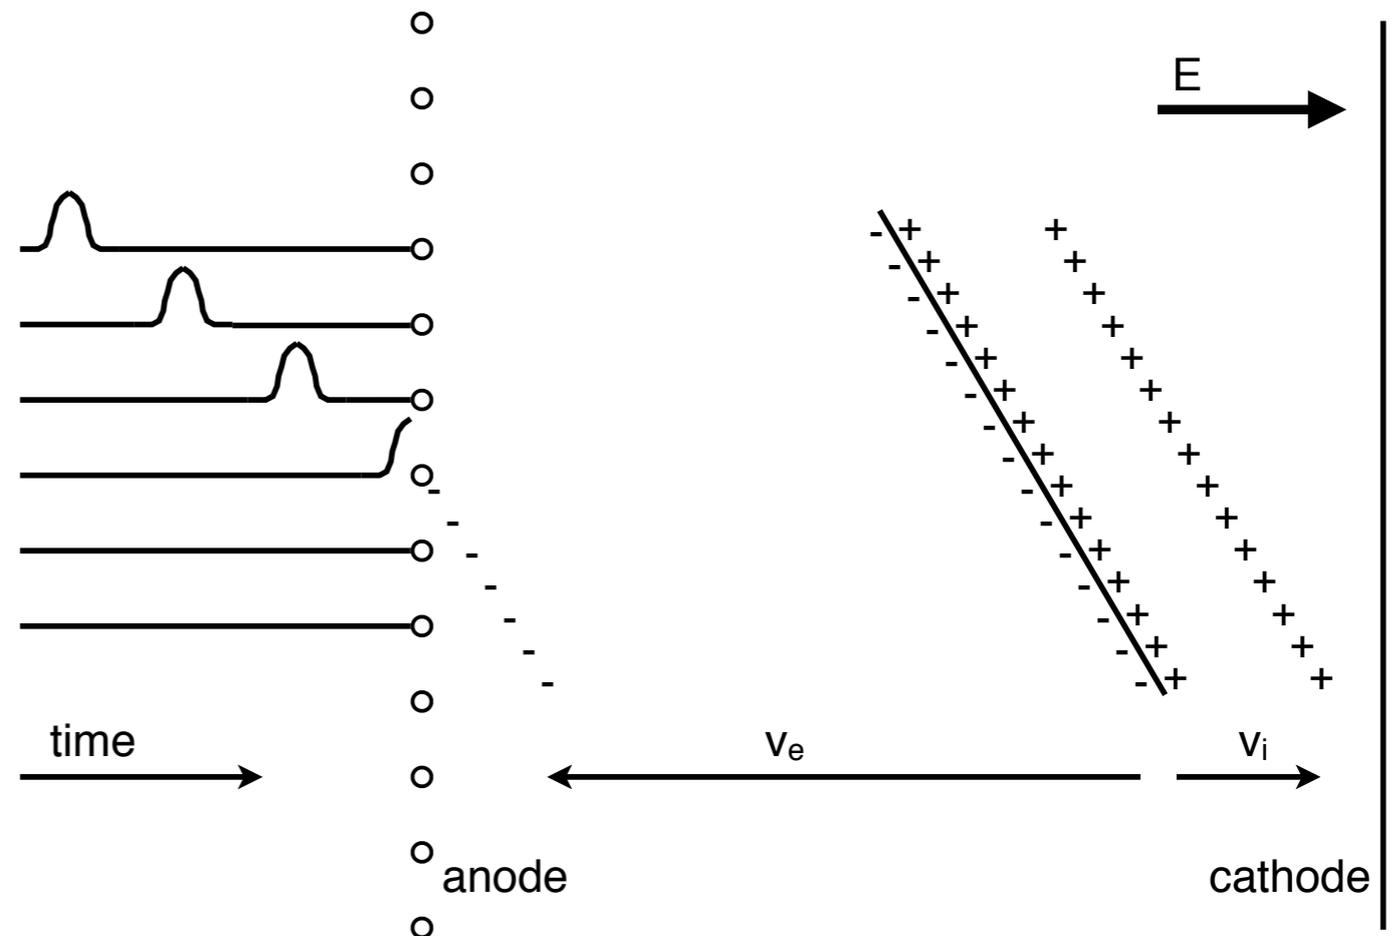

Ionised electrons along the track move 'rigidly' at a constant speed under the action of a uniform electric field.

Moving charge induce current pulses on sensing electrodes.

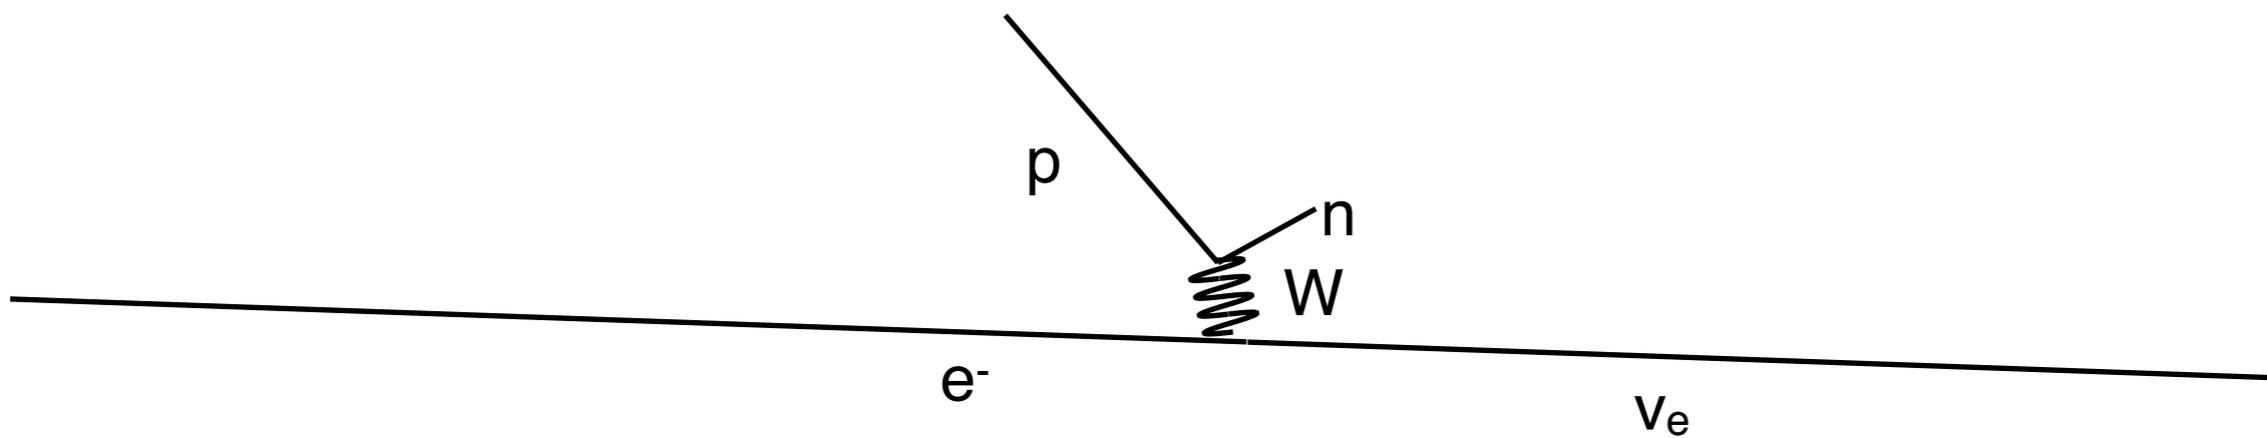

Drift direction projected on time domain

PID capabilities:

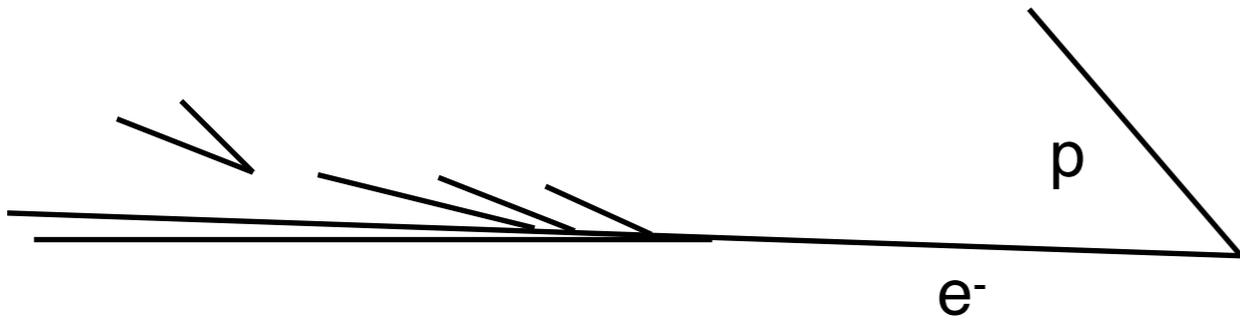

- charge density  $\sim dE/ds$
- topology of the event

# NP01 / WA104

Warm vessel construction at Fermilab by CERN  
Ready to host ICARUS. Next steps:

- Insertion of the two cold cryostats in the warm vessel
- Construction of the cryogenics by CERN contractors

# NP02 & NP04: ProtoDUNEs

NP02 and NP04 ProtoDUNEs Collaborations:  
very large subset of the LBNF-DUNE Collaboration

# Single vs double phase

## Single Phase (**SP**) à la ICARUS

### *Pro*

- demonstrated functioning underground for years
- drift in any direction with respect to gravity
- sensing electrodes are simple wires
- stable thermodynamic conditions of the detector
- no need of HV in gas

### *Cons*

- signal to noise limited by the electronics and wire length
- very different induction and collection view signals

## Double Phase (**DP**) liquid and vapour

### *Pro*

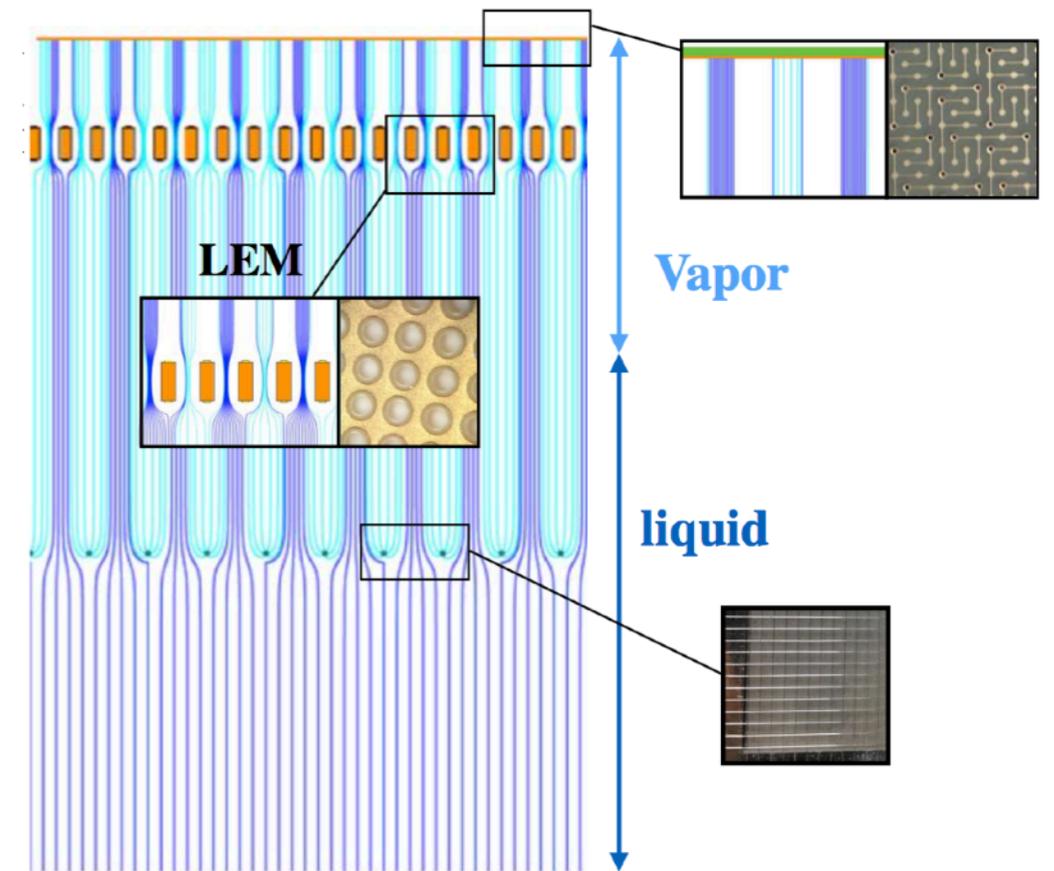

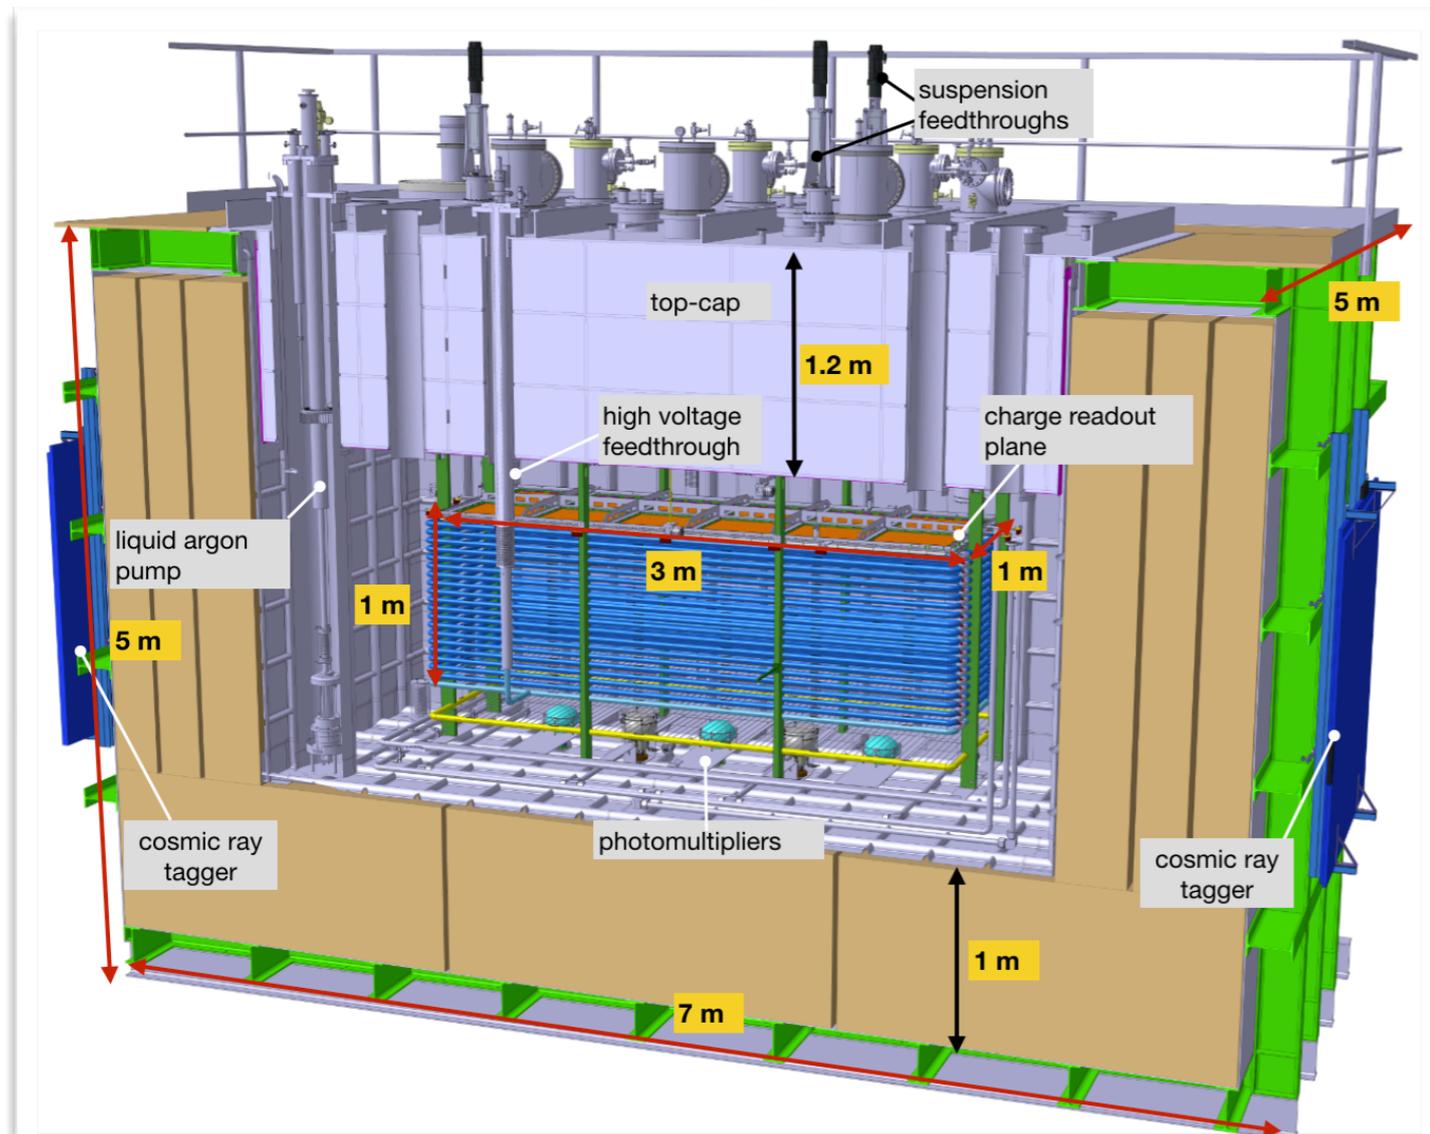

- signal amplification during just before signal formation
- electronic noise less important with respect to the SP
- completely analogous signals on the views
- possibly fewer electronic channels for the same volume
- accessible electronics

### *Cons*

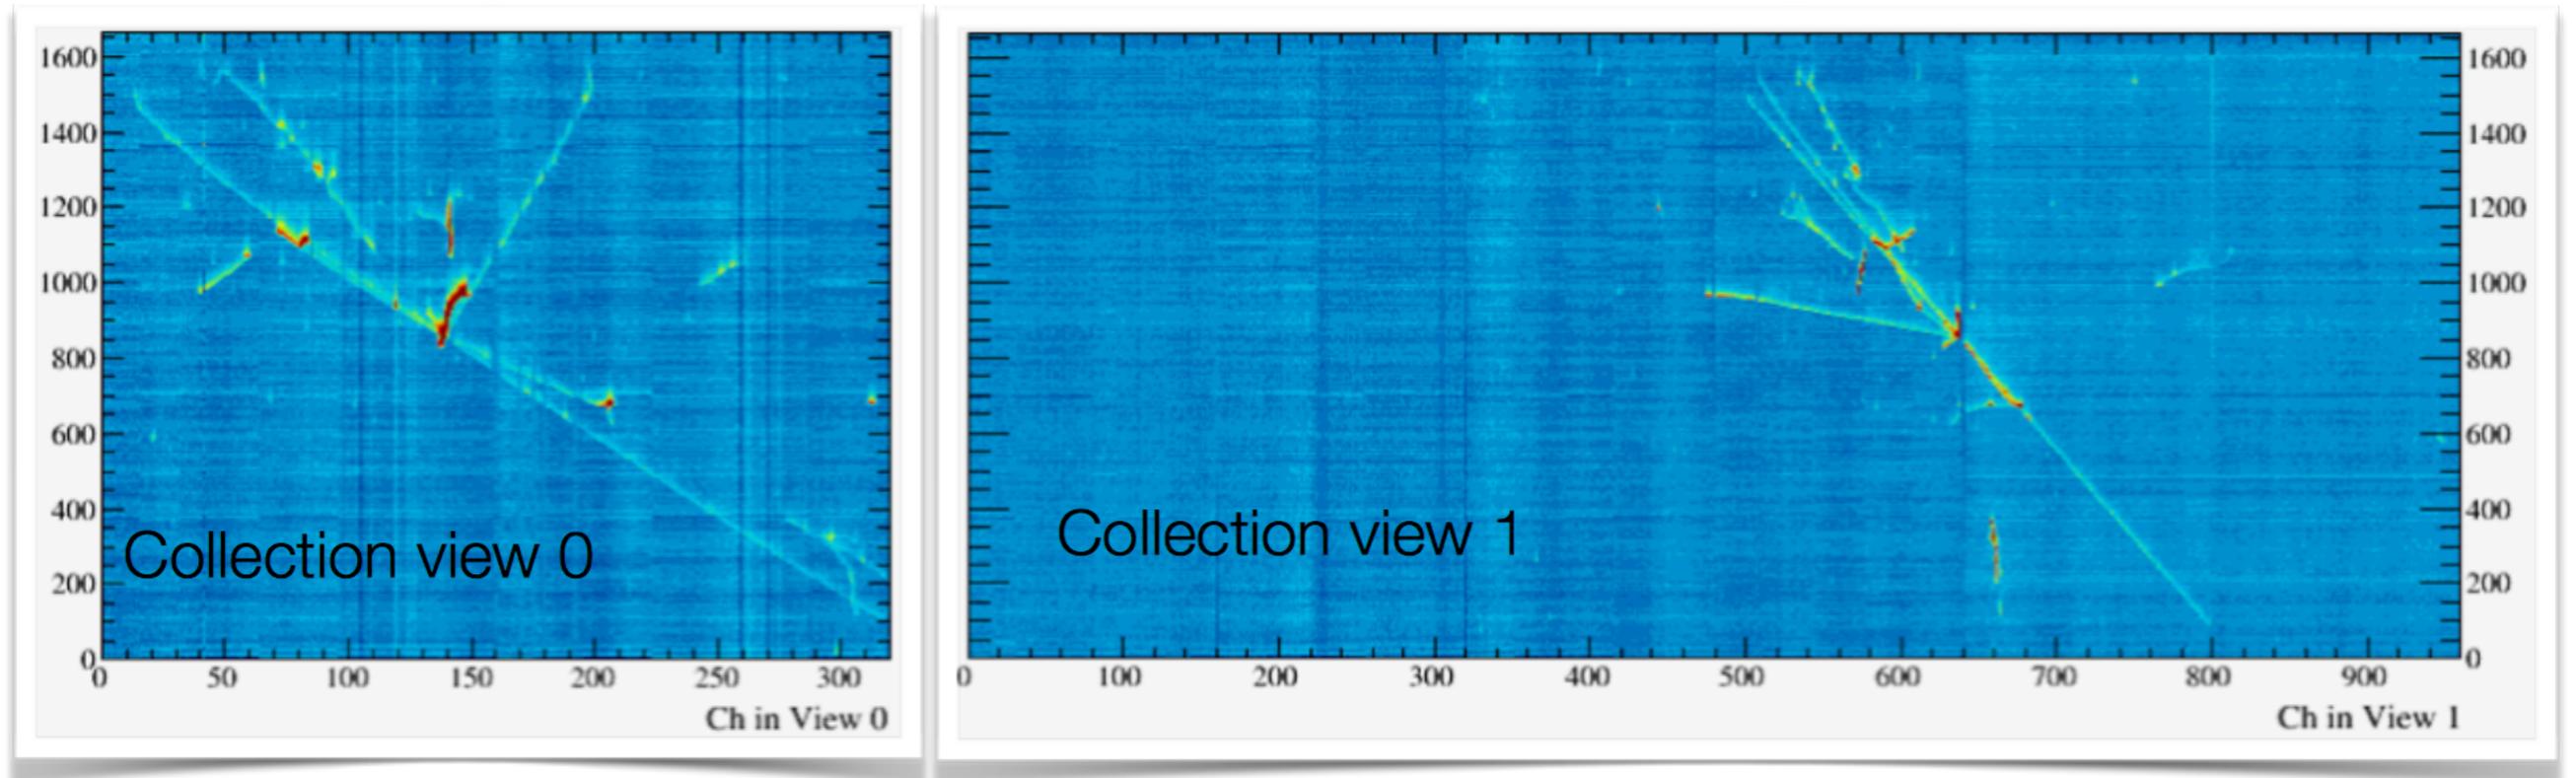

- stability and uniformity of the charge amplification
- generally larger HV needed

# Double phase argon TPC

3x1x1: Largest DP LAr TPC ever operated:  
3 m<sup>3</sup> active volume prototype and scalability demonstrator  
In operation at CERN since spring 2017

# 3x1x1 double phase TPC

High quality data illustrates the state of the art imaging of the dual phase technology:

- About 350 k cosmic events collected.
- Stable 500 V/cm drift field over one meter.
- Excellent performance of liquid argon pump.
- Liquid argon purity compatible with 10-20 ms free electron lifetime.
- First time achieved at CERN with a membrane cryostat.
- Liquid argon level stable at sub-mm scale.
- First time ever electron extraction over 3 m<sup>2</sup>
- LEM amplification demonstrated on the 50x50 cm<sup>2</sup> (final design for DUNE)
- Good S/N ratio on two collection views (3 meter and 1 meter strips)
- Some stability problems still under investigation and clarification

# EHN1 extension

Prototypes of the DUNE far detectors

Two almost identical cryostats, two 700 ton liquid argon TPCs, two very different technologies:

- double phase (NP02) and single phase (NP04) LAr TPC prototypes (full size components)
- on charge particle beam before LS2 (end 2018)

Approximate external dimensions  $11 \times 11 \times 11 \text{ m}^3$

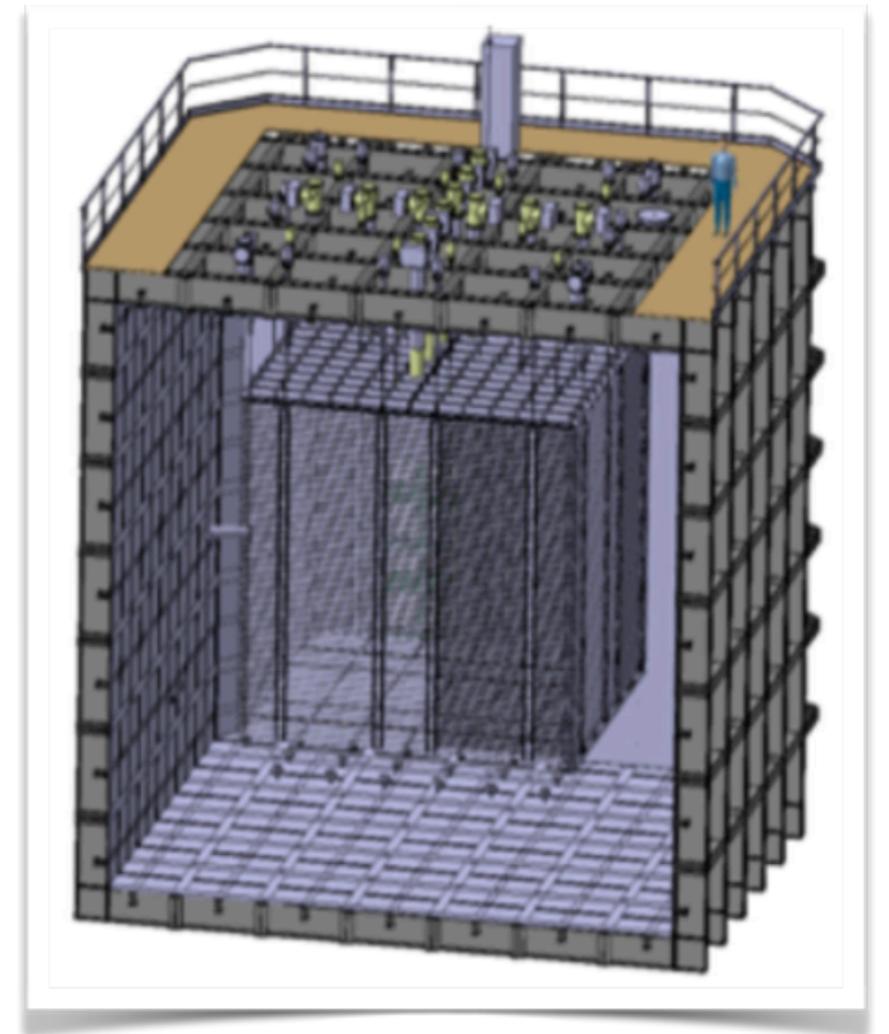

Approximate internal dimensions  $8 \times 8 \times 8 \text{ m}^3$

# ProtoDUNE

Engineering and functional prototyping and detector performance studies  
The critical components are fully representative of what will be in DUNE  
For instance the new technology for large volume cryostats.

## Double phase LAr TPC (NP02)

- The 3x1x1 is the prototype
- Active volume 6x6x6 m<sup>3</sup>
- Electrons drift vertically (6 m -> 300 kV at the cathode)
- Electrons are extracted in the vapour phase
- Electrons undergo charge amplification in the LEM holes
- Charge is equally shared between two orthogonal sets of strips on an anode
- Extraction, amplification and readout is modular 3x3 m<sup>2</sup> CRP
- Electronics is cold but extractable (special chimneys developed)

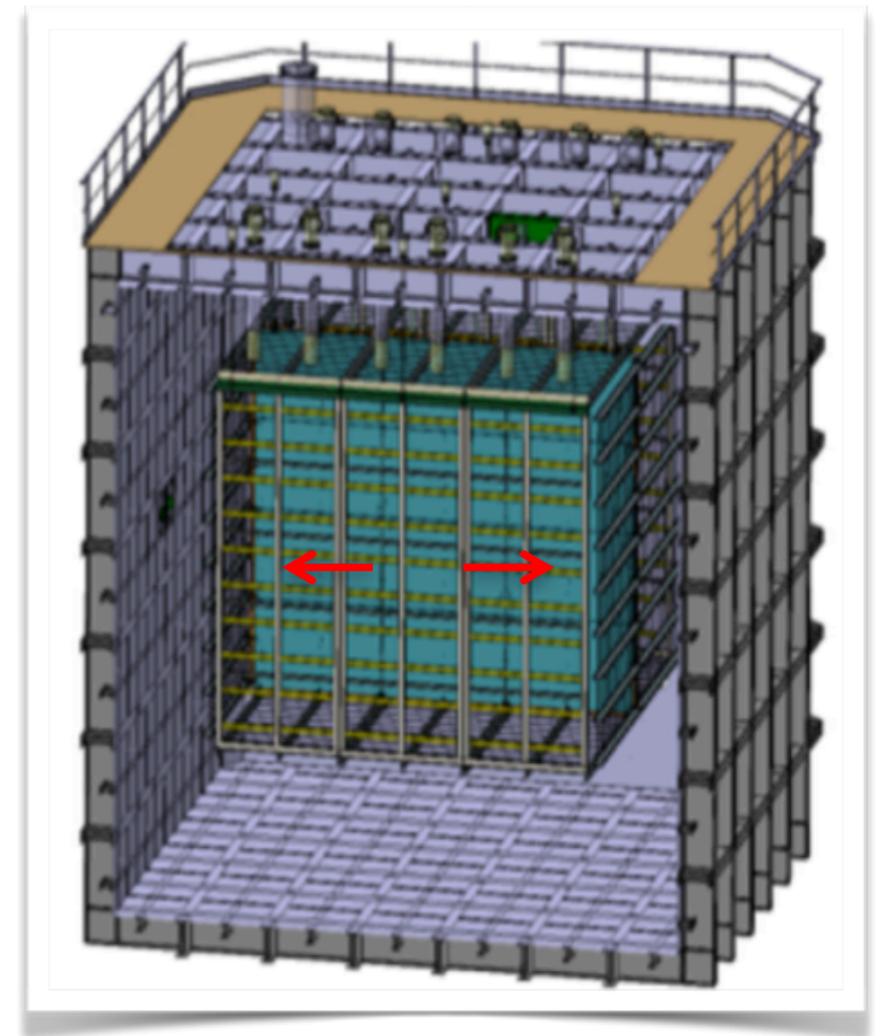

# ProtoDUNE

Engineering and functional prototyping and detector performance studies  
The critical components are fully representative of what will be in DUNE  
For instance the new technology for large volume cryostats.

Single phase LAr TPC (NP04)

- Active volume  $\sim 6 \times 6 \times 7 \text{ m}^3$
- Electrons drift horizontally orthogonal to the particle beam
- two drift length of 3.6 m  $\rightarrow$  180 kV at the cathode
- Electrons drift in liquid and induce signals on wires
- Wires wrapped around APAs (full DUNE size) to gain modularity
- Electronics installed in liquid argon  $\rightarrow$  improve S/N ratio
- Light readout modules embedded in the APA system

# LAr purity

Electronegative contaminants spoil the LAr TPC signals  
O<sub>2</sub> molecules attach to drifting electrons slowing them down

HV and UHV to clean the TPCs is the classical solution:

- remove the air at the beginning
- improve the outgassing of the material
- simple to find leaks towards the atmosphere

Not feasible within the budget to build large cryostat that can be put under vacuum

The same is valid for the vacuum insulation. Approach:

- Air is evacuated at the beginning gently flowing pure gas argon from the bottom
- Argon gas is recirculated through getters to maintain the purity in warm
- Leaks must be found in another way

# The technology

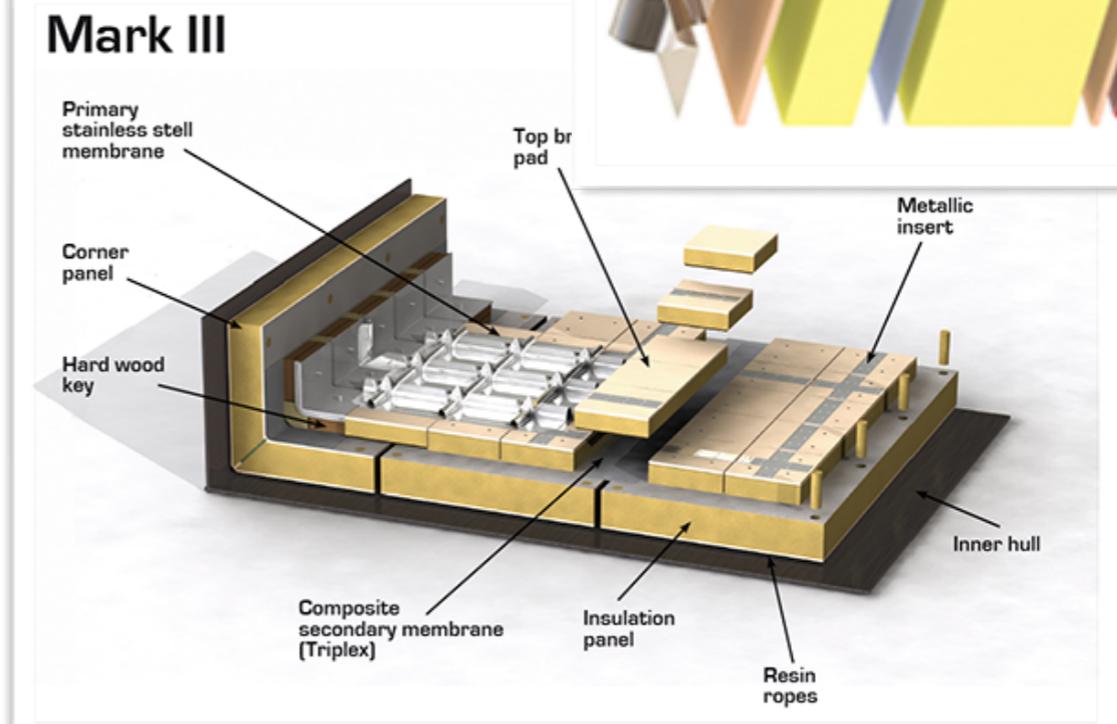

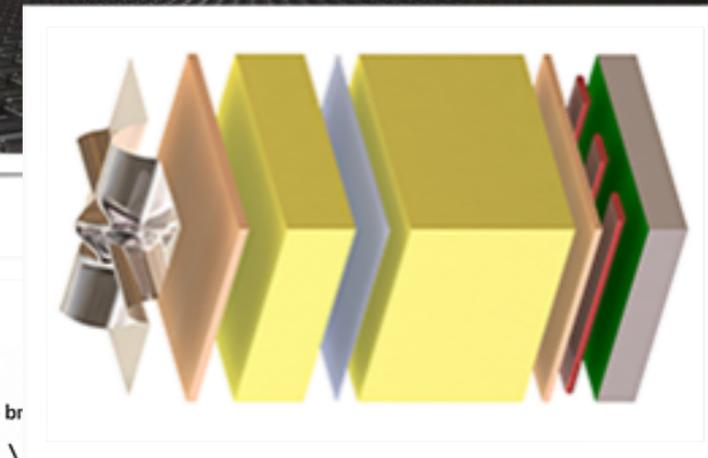

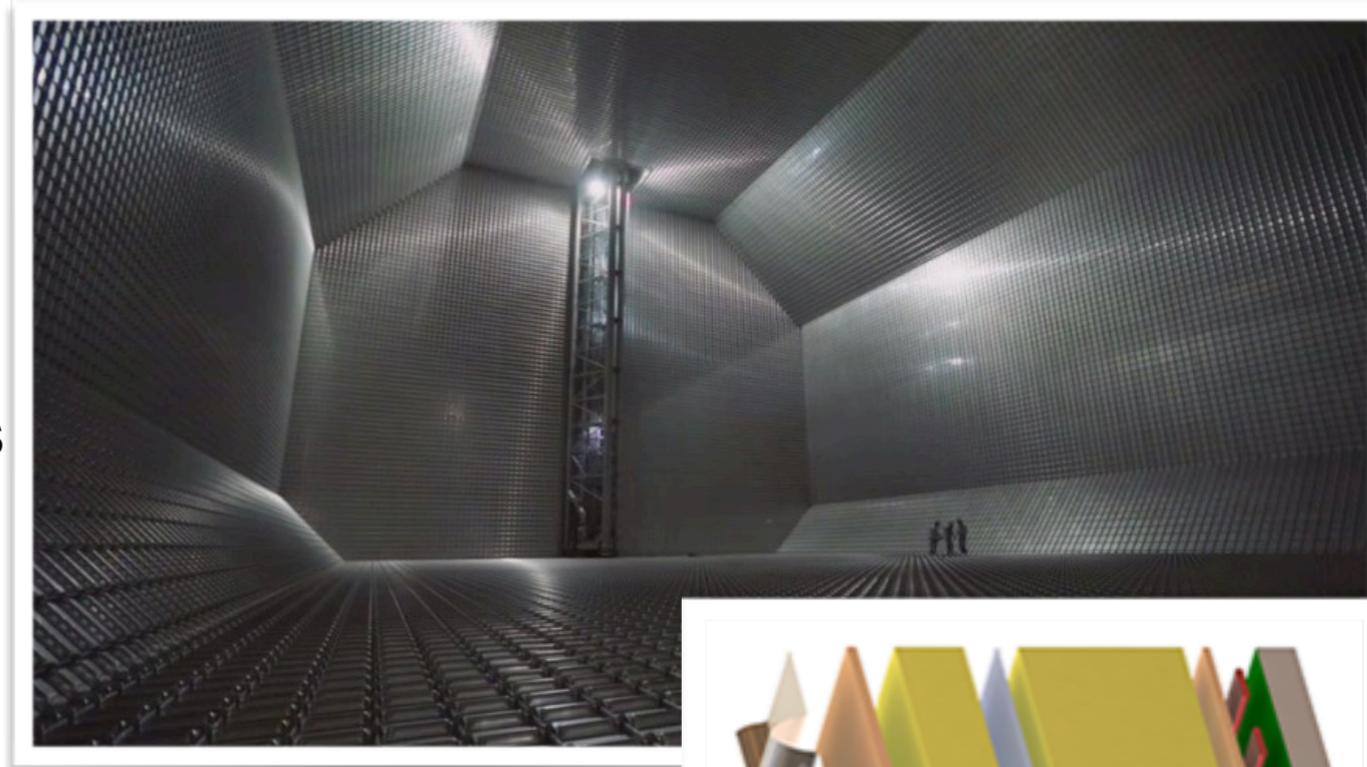

Royalties owner: GTT (France)

Licensee: Gabadi (Spain) among several

Applications:

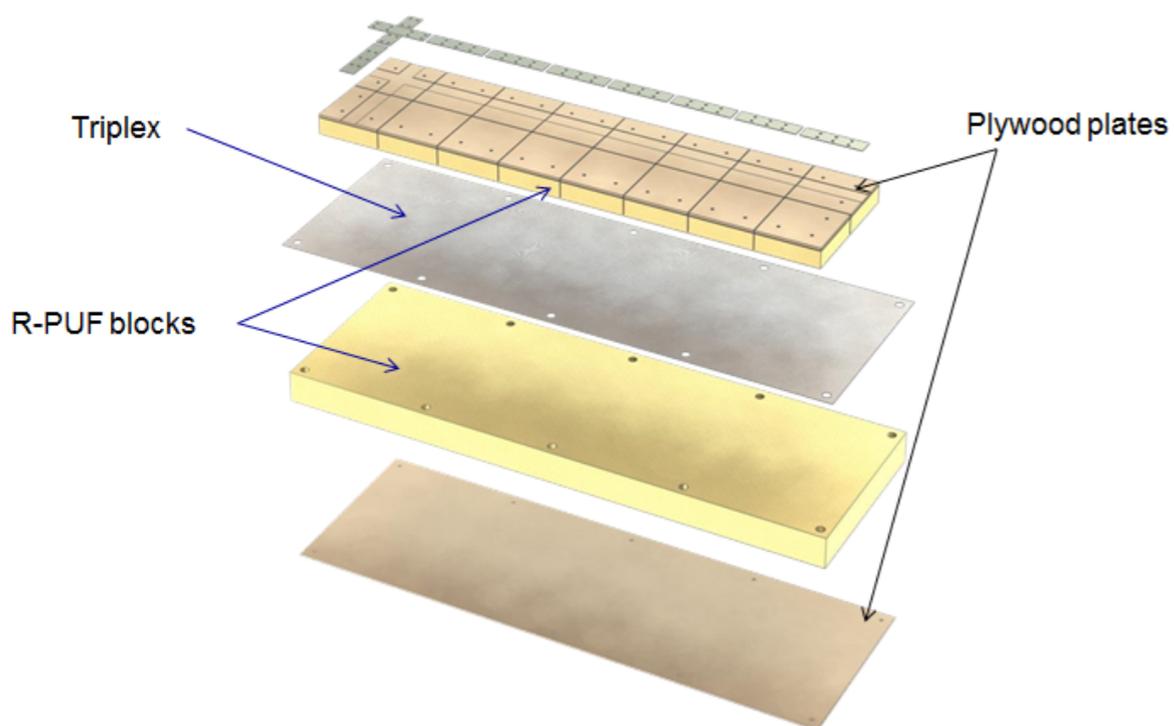

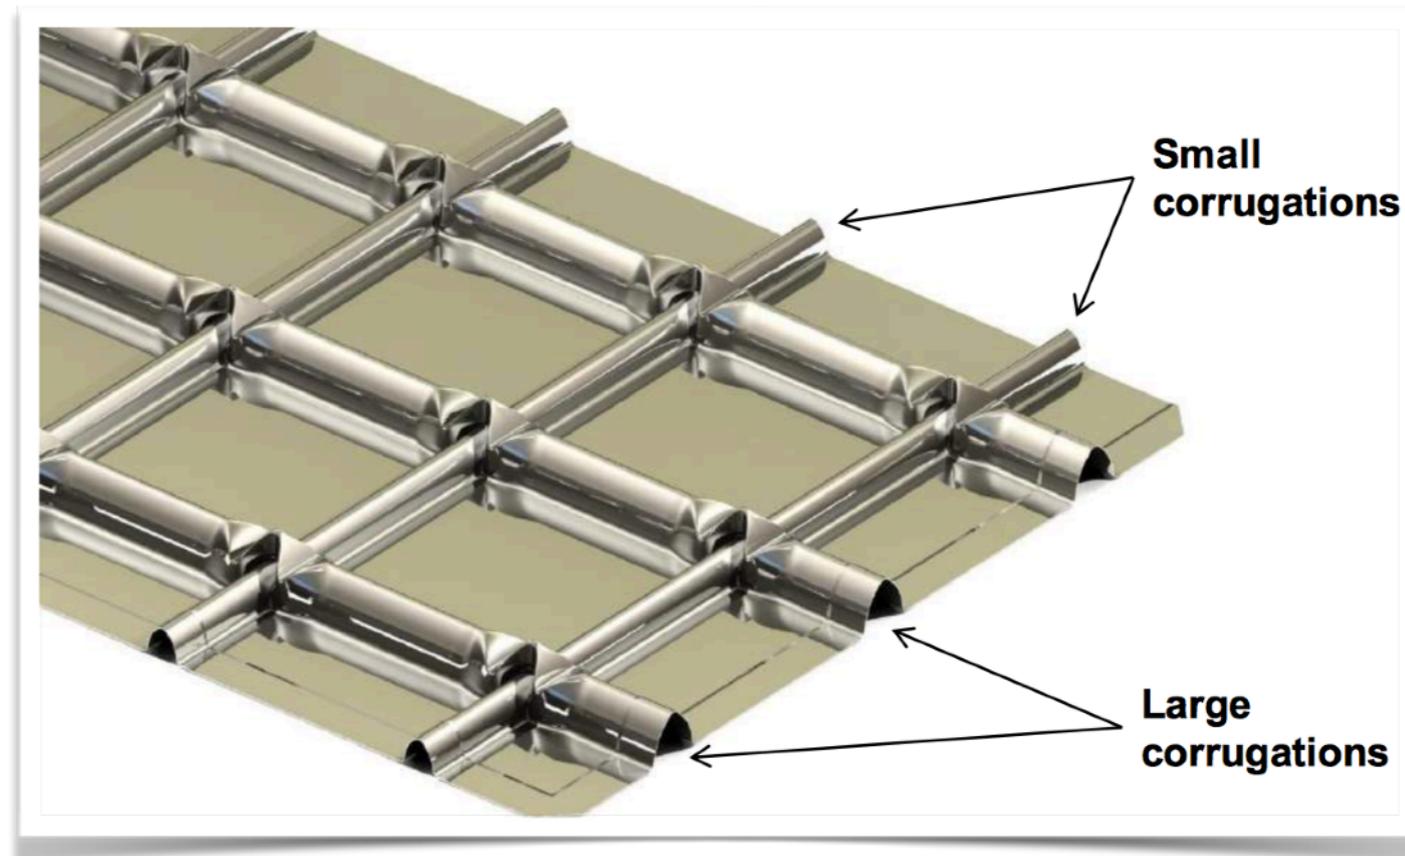

- LNG carriers (>200000 m<sup>3</sup> in 5 sub-tanks)
- Floating storages and re-gasification vessels
- Land storage tanks
- Fuel tank for vessels
- Cryostats for LAr TPCs

- Primary membrane: in contact with the liquified gas. Flexible and elastic to accomodate wave impacts, vessel deformation, thermal expansion and contraction. Not self supporting.
- Thermal insulation: passive, in between and directly connected to the primary membrane and the hull.
- Hull: the warm structure, sustains and support the entire system.

# GTT Mark III technology

Primary membrane:  
Stainless Steel 304L, 1.2 mm thick, 1mx3m 'tiles' (eventually welded together), with corrugation (acting as springs) along the two orthogonal directions (340 cm pitch). Highly standardised components, constructed in Korea. Special components for angle and corner pieces.

Insulation:  
Typically 27 cm thick, two polyurethane foam layers separated by the secondary membrane. Metal inserts on the plywood serve as welding points for the primary membrane. No direct metal contact between warm structure and primary membrane. Highly standardised prefabricated components, constructed in Korea. Special components for angle and corner pieces.

[www.gtt.fr](http://www.gtt.fr)

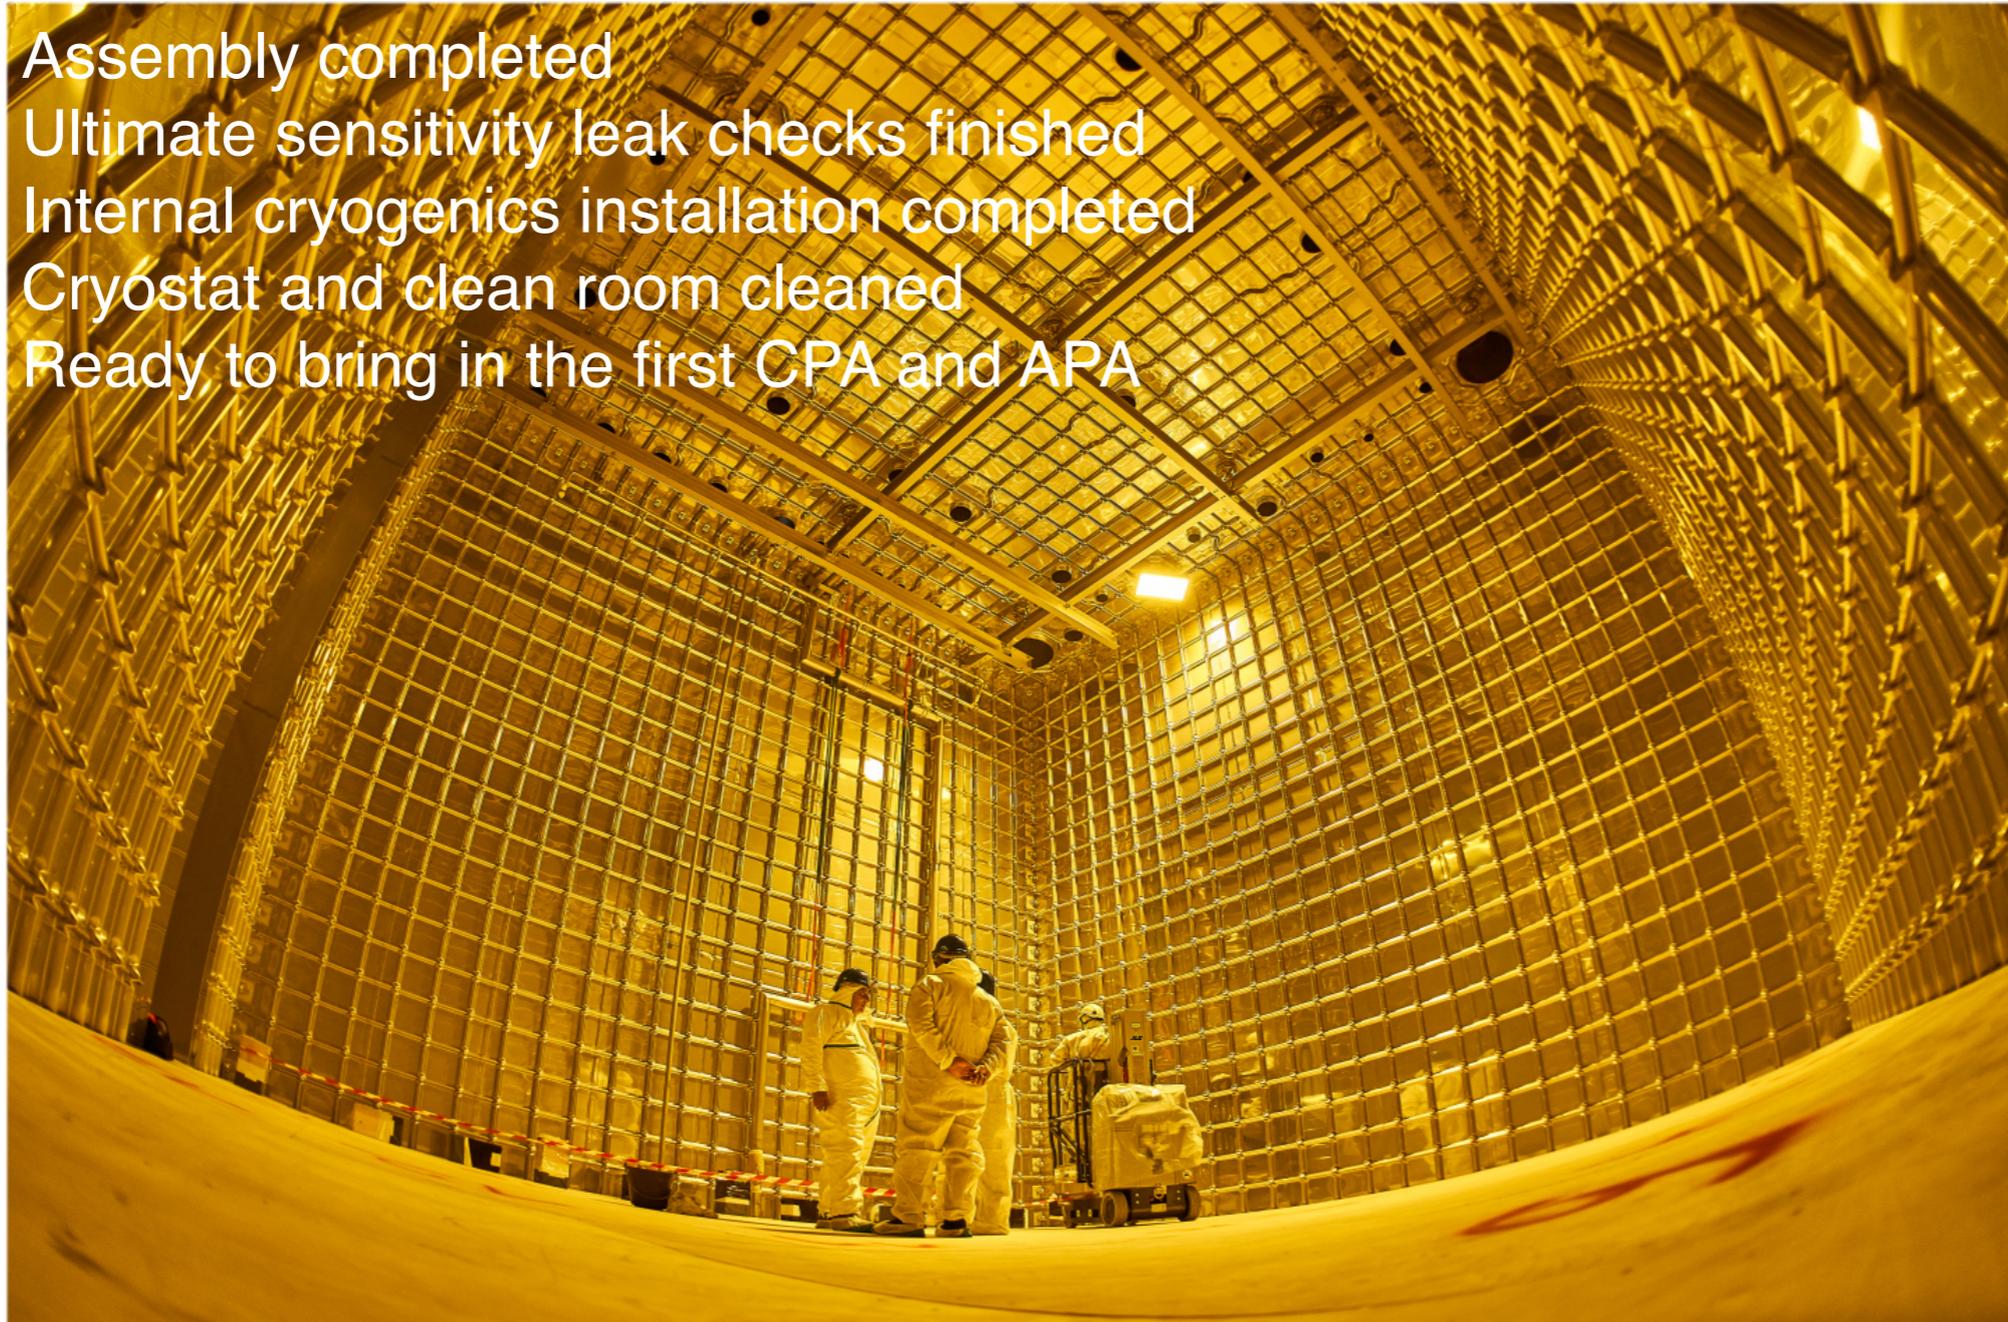

# NP02 double phase

Assembly completed  
Ultimate sensitivity leak checks finished  
Internal cryogenics not yet installed  
Cryostat and clean room cleaned  
Start field cage installation this week

# NP04 single phase

Assembly completed  
Ultimate sensitivity leak checks finished  
Internal cryogenics installation completed  
Cryostat and clean room cleaned  
Ready to bring in the first CPA and APA

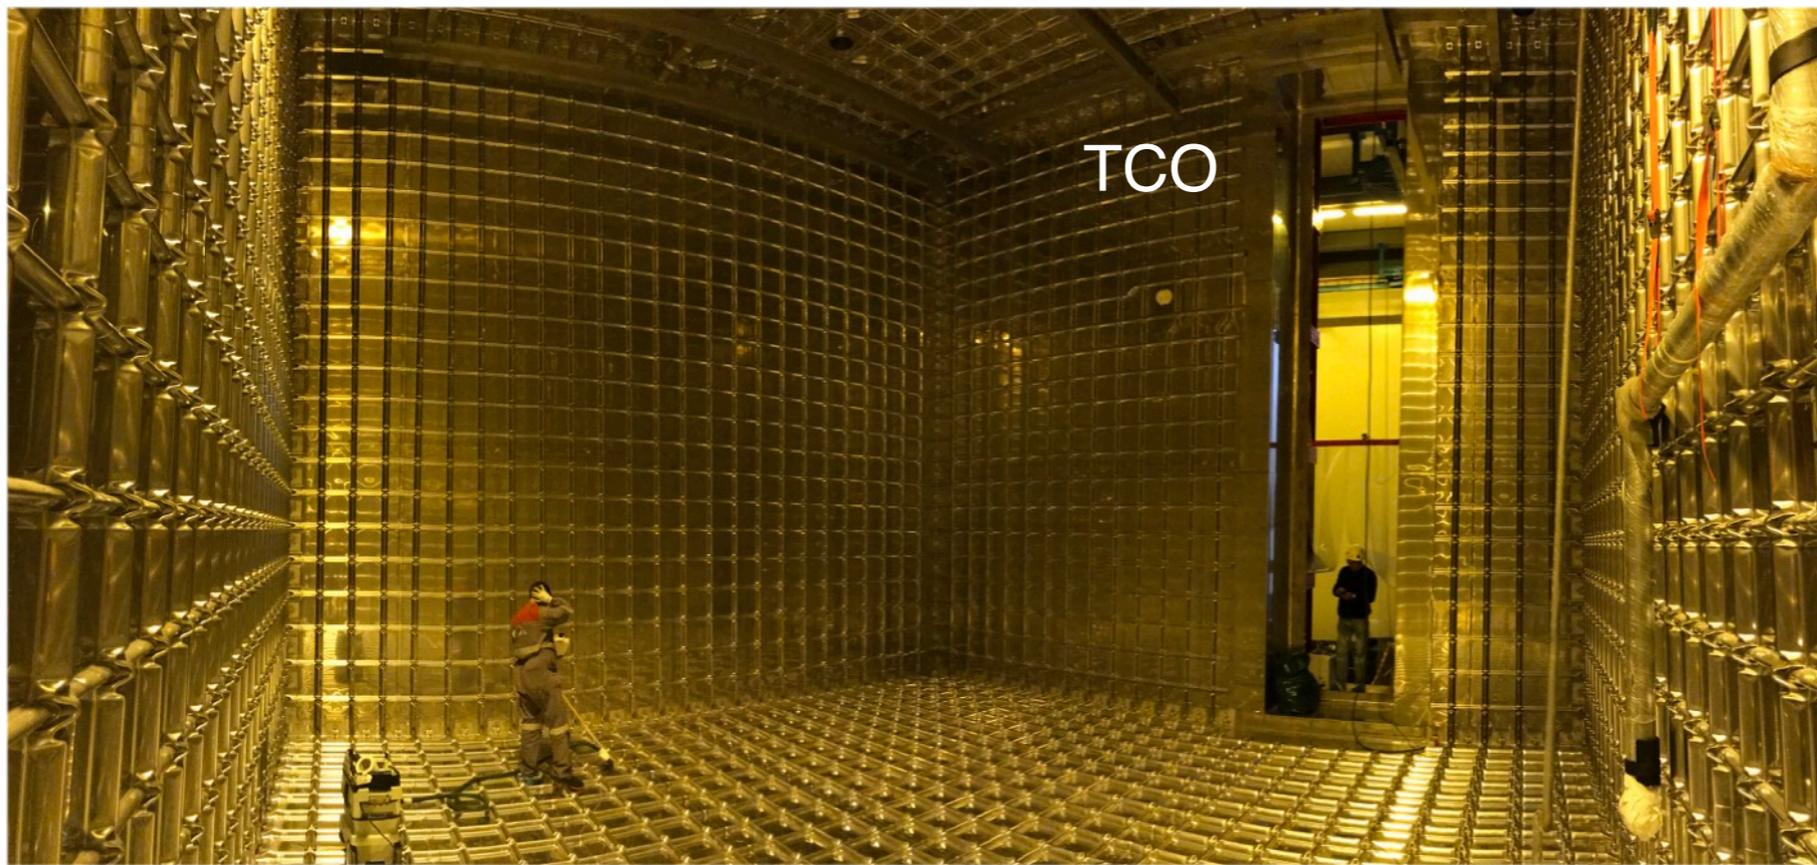

# ProtoDUNE cryostats

Differences with LNG tanks:

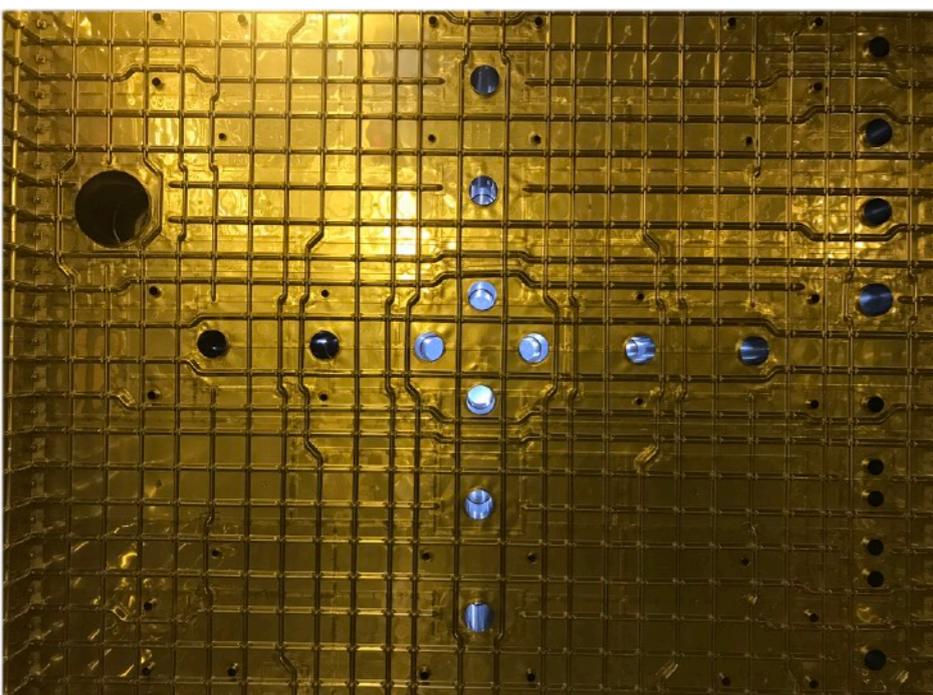

- LAr instead of LNG (LAr is denser)
- Smaller ( $\sim 8 \times 8 \times 8 \text{ m}^3$  compared to  $\sim 30 \times 30 \times 40 \text{ m}^3$ )
- No sloshing issues except in case of earthquake (anyway minor waves)
- Several openings - typically on the roof - for feedthroughs, detector support, cryogenic lines, ...
- Beam entrance (missing insulation to minimise beam perturbations)
- More stringent requirement on heat input ( $5\text{-}7 \text{ W/m}^2$ )  $\rightarrow$  79 cm thick insulation
- Installation of the detector: activities going on inside the cryostat for months after the cryostat is 'completed'
- Temporary Cryostat Opening (TCO) that is closed at the very end

# ProtoDUNE features

Roof openings (from inside)

Roof openings (from outside)

# Warm structure

About 250 ton of steel in total

Support structure: carbon steel IPE600 1.6 m pitch interleaved with IPE240

Warm skin: 10 mm thick stainless steel 304L (gas tight welded)

Rated for: weight of the detector + weight of LAr + 350 mbar overpressure

NP04: started 15 August 2016 finished 7 January 2017 -> 21 weeks

NP02: started 7 January 2017 finished 13 March 2017 -> 9 weeks

Manpower: 10 Technicians, 9 welders and 4 crane drivers

Components welding

Floor preparation

Wall handling

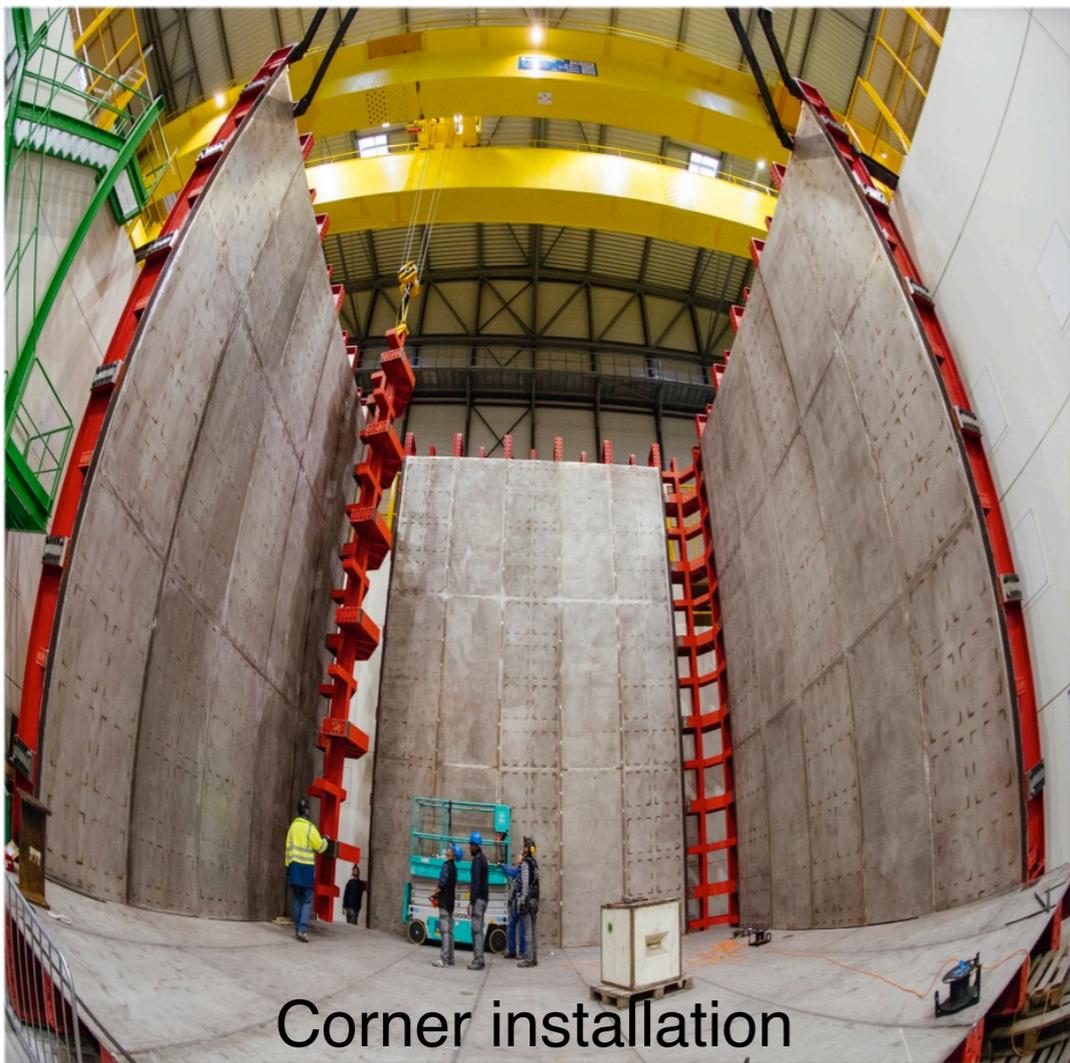

Roof installation

Final welding

Corner installation

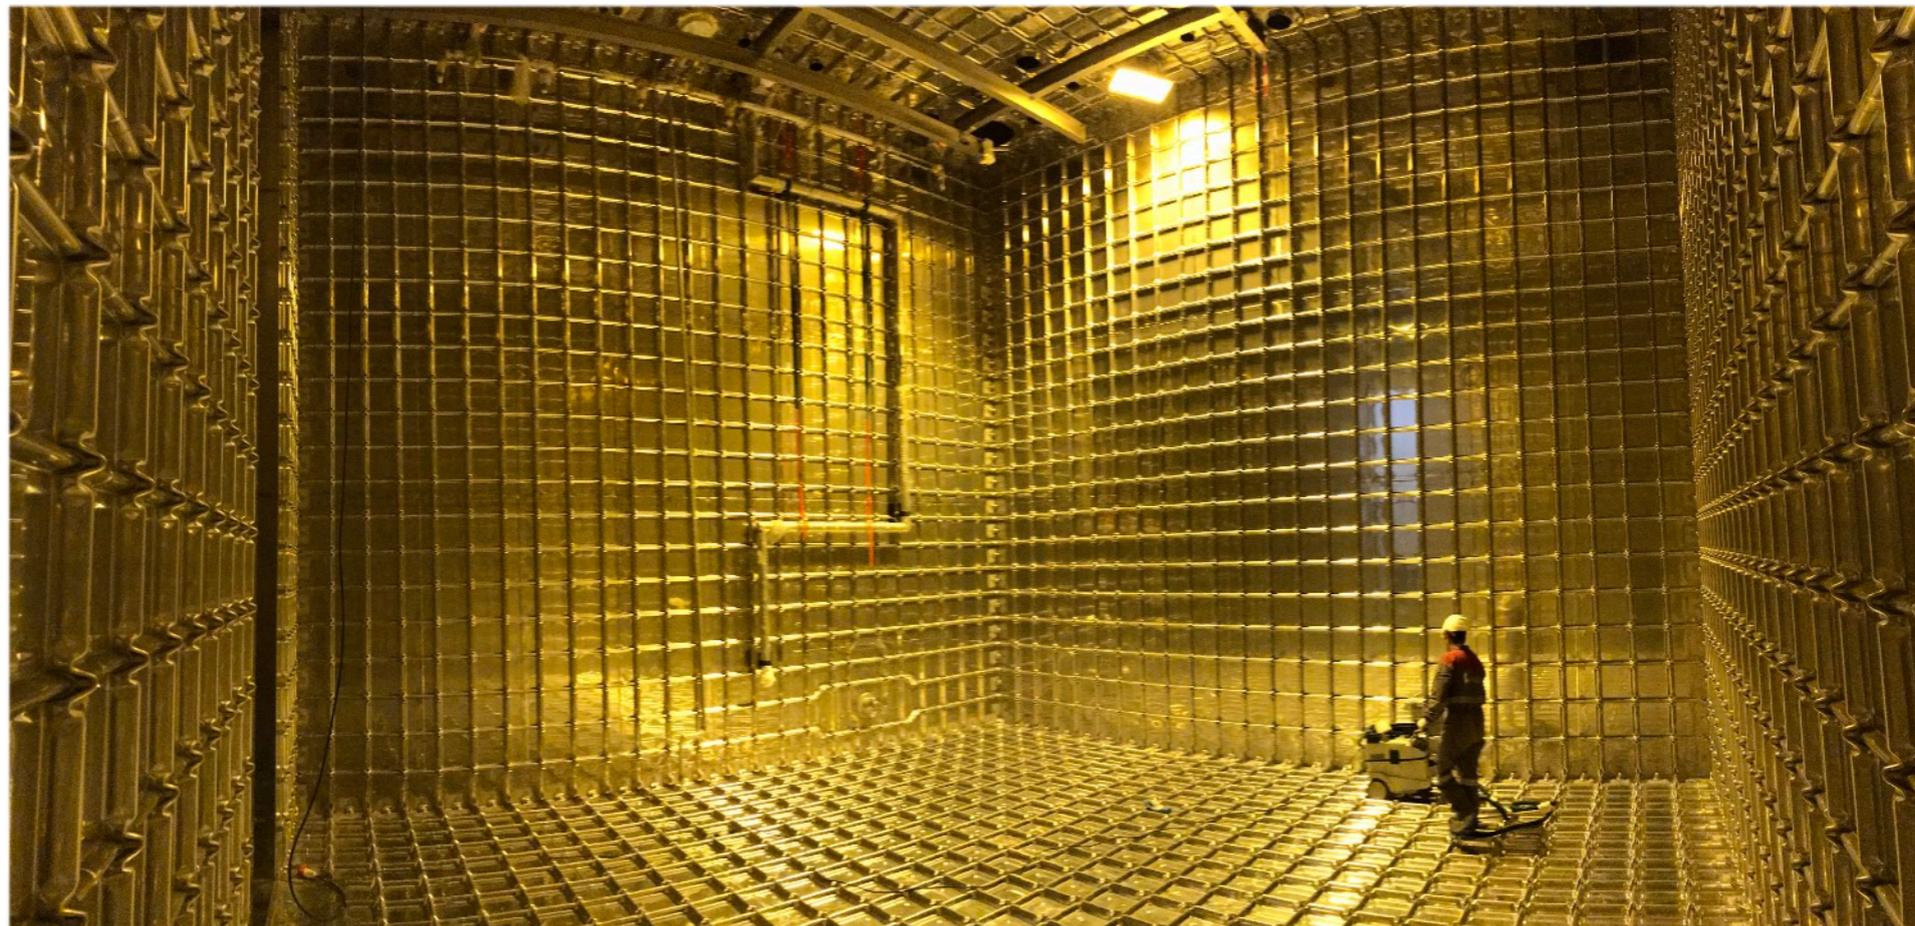

# Insulation and membrane

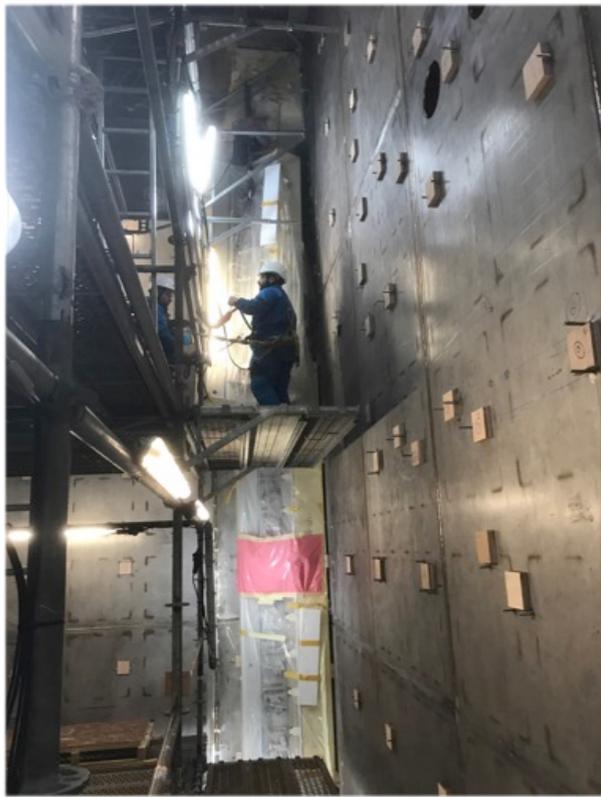

Up to about 60 workers (engineers, carpenters, welders, foreman, technicians, scaffolders):

- Gabadi for construction work, welding, and management
- GTT for quality control and supervision

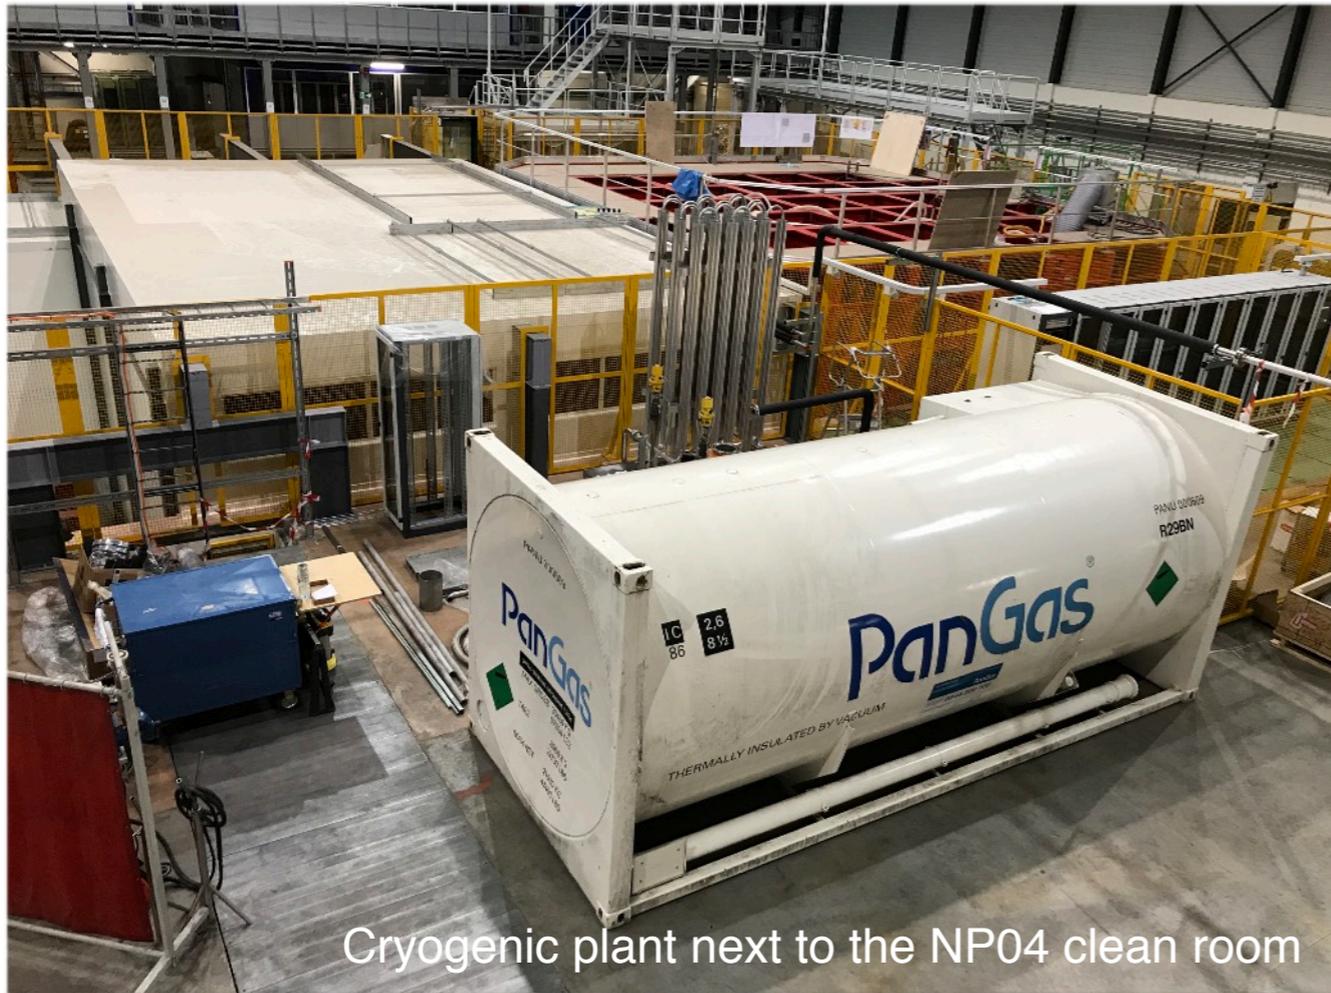

NP04 (handover on 7th January)  
start date 9th of January  
last welding 1 September (34 weeks)  
Scaffolding removal 11 October

NP02 (handover on 13th March)  
start date 13th of March  
last welding 22 September (28 weeks)  
Scaffolding removal 10 October

# Cold test box

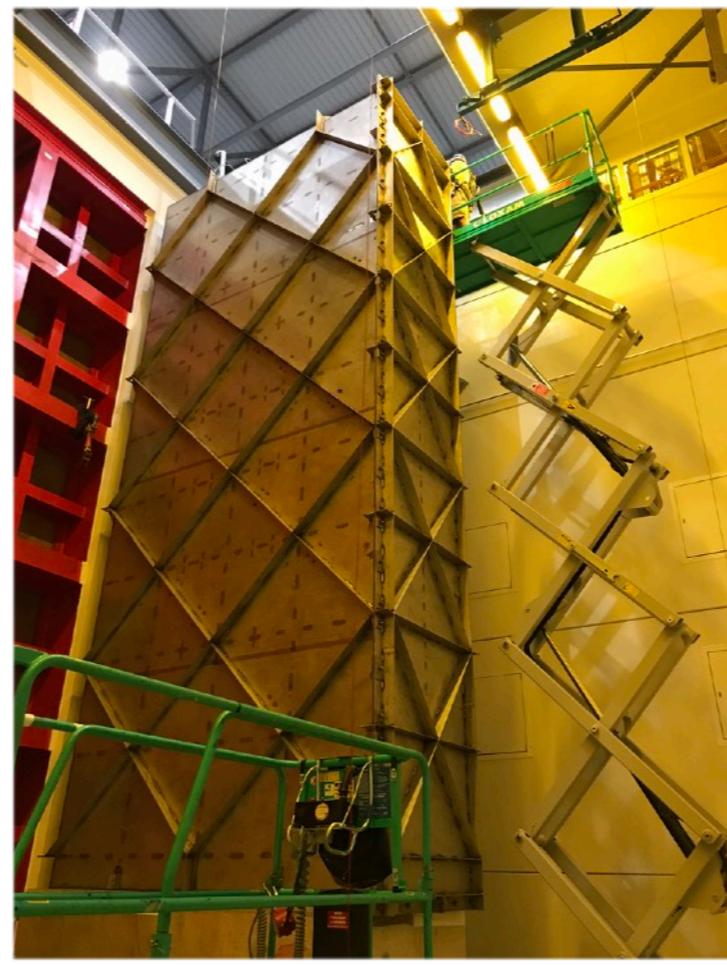

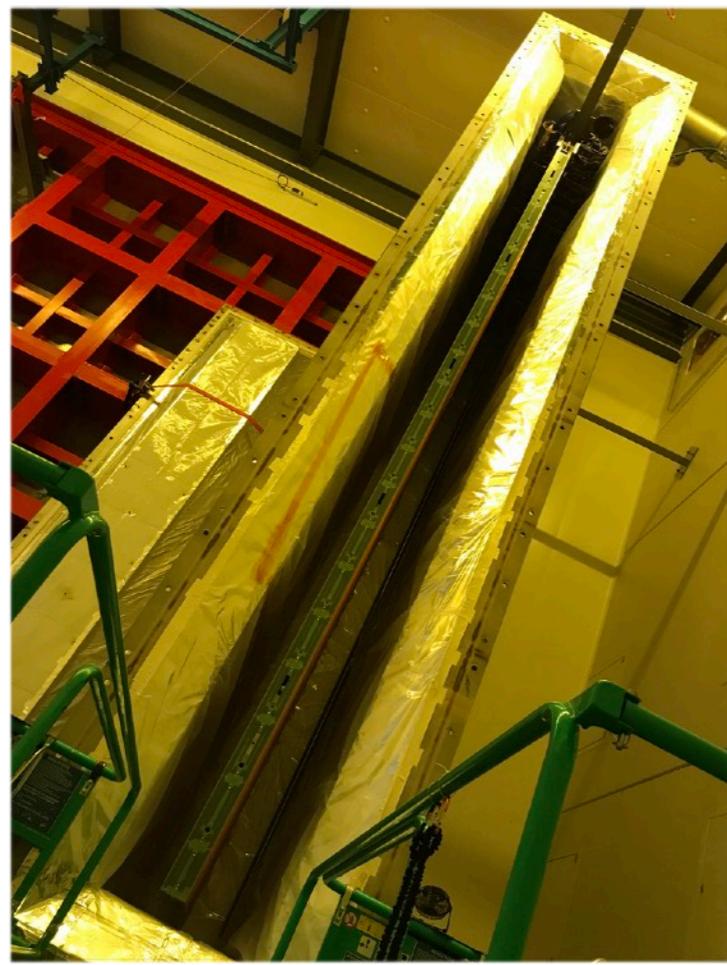

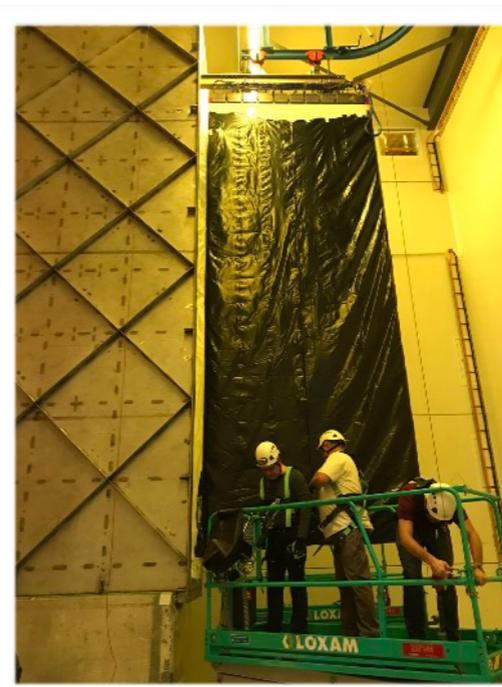

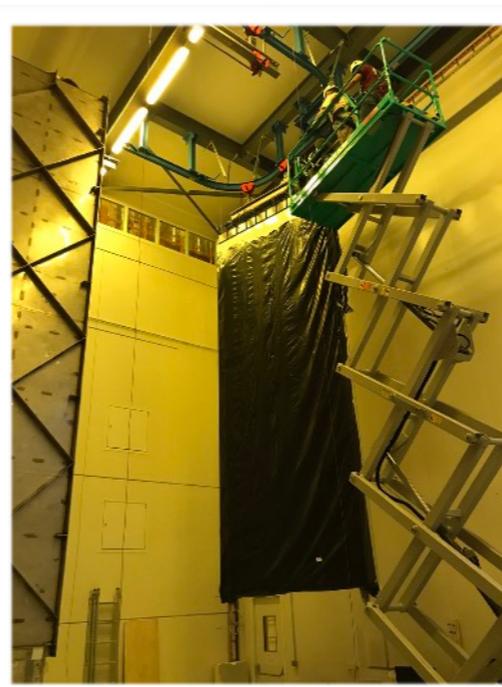

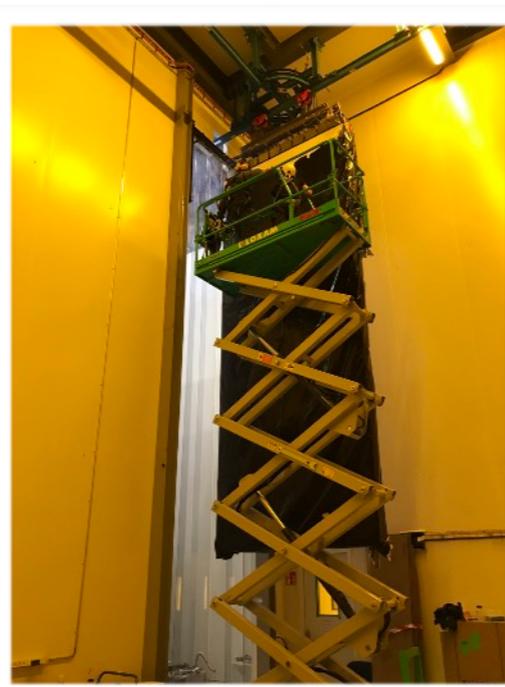

Cryogenic plant next to the NP04 clean room

- SS structure with passive thermal insulation
- Installed in the NP04 clean room
- DSS beam to hold the APA
- 7 m tall door gives access to the APA
- Cooled ( $\sim 150\text{K}$ ) flushing cold  $\text{GN}_2$
- $17\text{ m}^3$   $\text{LN}_2$  dewar provides the cold gas
- Cryo-control integrated in the DCS

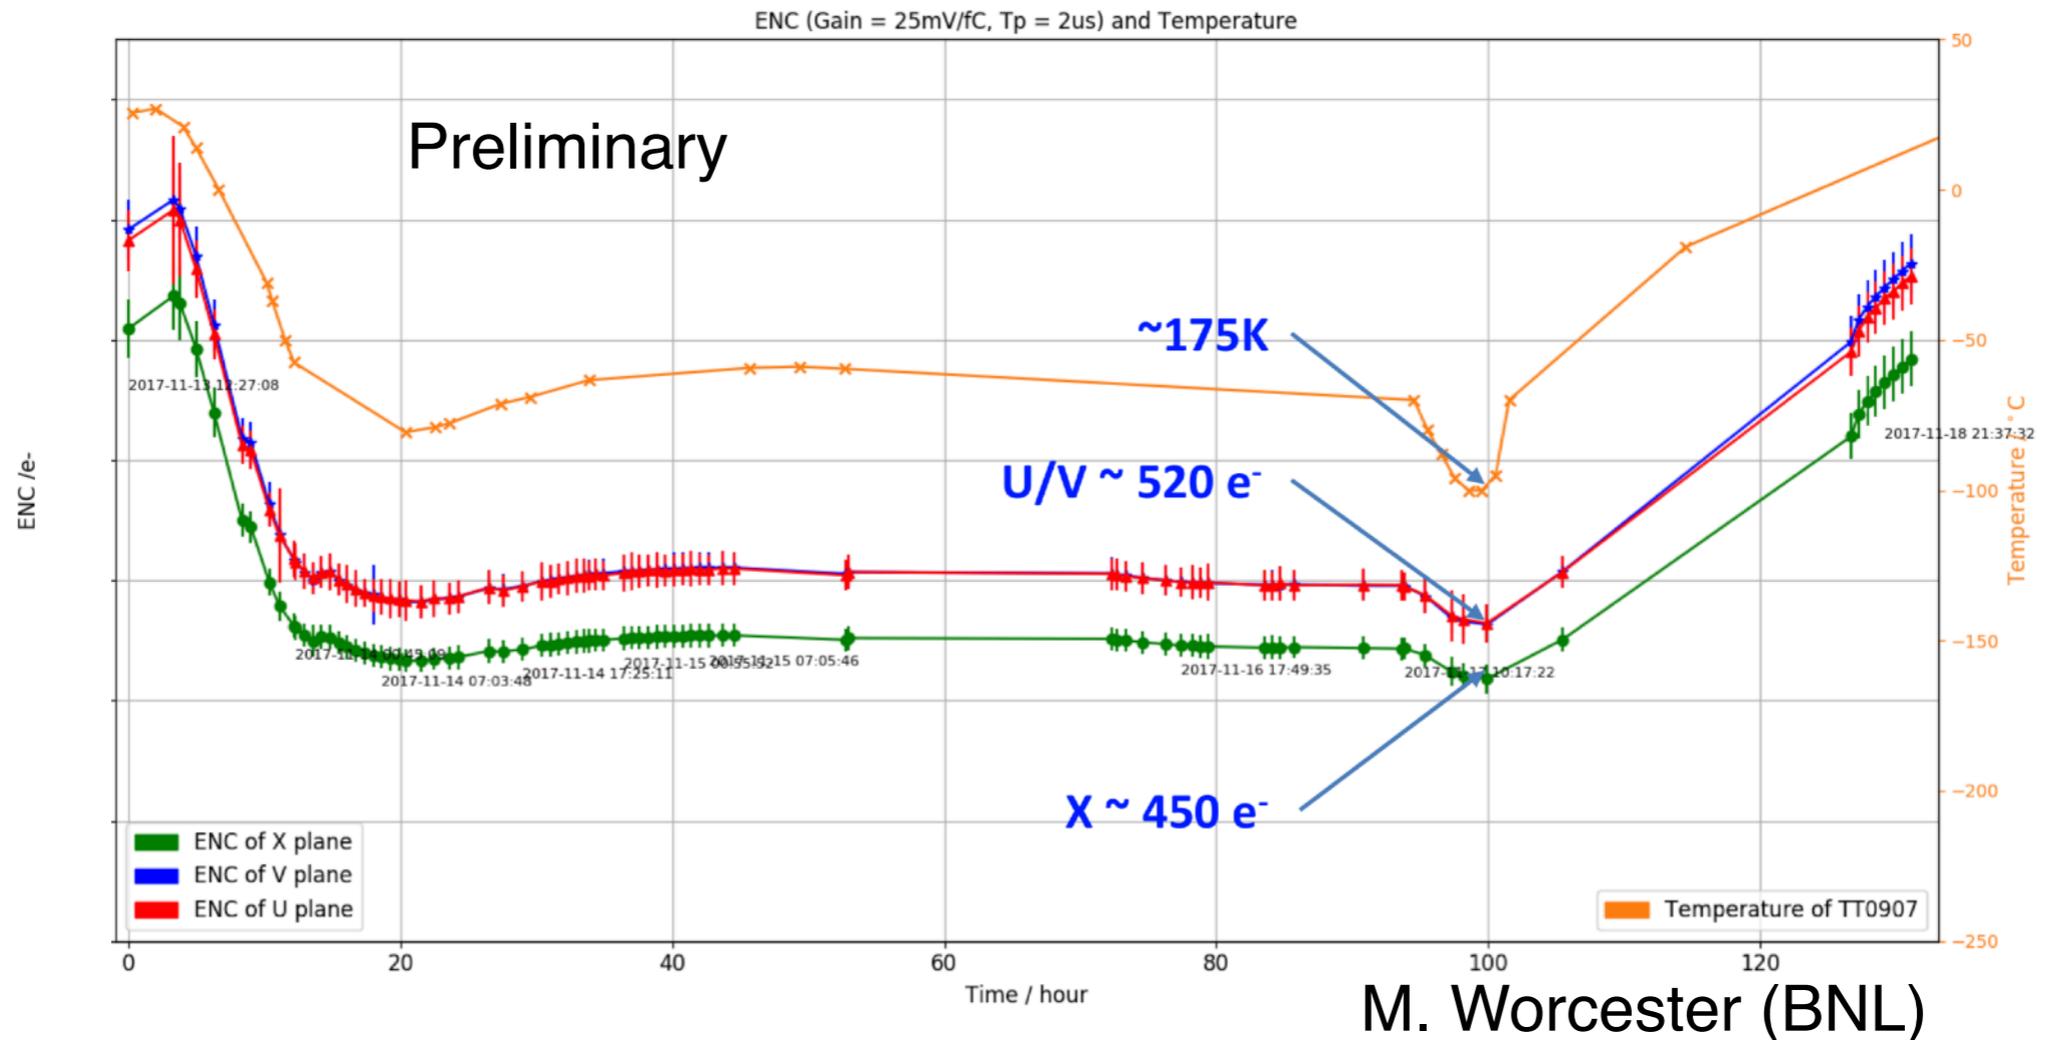

Cold box open inside the NP04 clean room

# APA in cold box

# APA in cold box

First cool down of the cold box with the APA inside finished last weekend

# Additional activities

Combine **DCS and DAQ**, exporting the Front-End-Link-EXchange (FELIX) technology (à la ATLAS) from collider experiments to neutrino experiments

Online **computing farm**  
(more than 1000 cores)  
Data storage based on EOS  
Tier0 for protoDUNE data

Production of the **field cages** for both NP04 and NP02  
**HV systems** (aluminium field shaping rings, resistive cathode, HV feedthrough, ...)  
Production of the single phase **cathode** system  
**Technical infrastructure** (cooling, ventilation, electricity, building, safety, cranes, access, ...)  
Two new **beam lines** (extension of H2 and H4 beam lines)  
Activities in event **reconstruction, simulations, data analysis** with CERN EP-NU

# Near detector related work

DUNE Near detector workshop <https://indico.fnal.gov/event/14737/other-view?view=standard>

**3rd DUNE Near Detector Workshop**  
 chaired by Alfons Weber (University of Oxford and STFC/RAL), Kam-Biu Luk (UC Berkeley)  
 from Monday, November 6, 2017 at 09:00 to Tuesday, November 7, 2017 at 18:00 (Europe/Zurich)  
 at CERN ( 06.11 Council Chamber, 07.11 Room Chrapak )

**Description** By spring of 2018, we will converge on the conceptual design that the DUNE collaboration intends to take forward. This workshop is part of this process. At this moment, we have settled on a hybrid option with a liquid-argon TPC without a magnetic field followed by a magnetized spectrometer with a relative low-mass tracker surrounded with electromagnetic calorimeter and muon detectors. The low-mass tracker can be either a straw-tube tracker or a gaseous-argon TPC. This meeting will focus on the options of the magnet, comparison of the performance between the low-mass tracking options, electromagnetic calorimeters, and gain better understanding of the scientific potential of the 3-D scintillator detector and the PRISM concept in DUNE. The goal is to gather additional information for further narrowing the phase space for defining the final conceptual design of the near-detector system. The meeting is open to existing DUNE collaborators and any potential new collaborators with an interest in participating in the design, planning and construction of the DUNE near detector system.

**Material:** Vidyo sessions

Monday, November 6, 2017

09:00 - 09:20 Introduction  
 Material: slides

09:00 **Plan of ND and Goals of this workshop (15'+5') 20'**  
 Speakers: Kam-Biu Luk (UC Berkeley/LBNL), Prof. Alfons Weber (University of Oxford and STFC/RAL)  
 Material: Slides

09:20 - 10:30 Tracking in a Magnetic Field  
 09:20 **Questions To Be Answered on Magnet (5') 5'**  
 Speaker: Kam-Biu Luk (UC Berkeley/LBNL)  
 Material: Slides

## Plan of DUNE Near Detector and Goals of Workshop

Kam-Biu Luk (UC Berkeley and LBNL)

### Status of Near Detector Concept

- Agreements reached in June Workshop
  - A LAr TPC followed by a magnetized Multi-purpose Tracker (MPT)
  - LAr TPC is not magnetized
  - Baseline of near site = 574 m unless LBNF can reduce cost by moving closer
  - Underground near hall should be 50% larger than the one in CD-IR
- These agreements have been submitted to the Executive Board

### Milestones

See Mark's talk 19-Oct2017

Target date	Milestone	Type	Tier	Original date	Complete	
20	Jan-17	Launch of expressions of interest in ND Concept Study	ND	2	Jan-17	Feb-17
24	Mar-17	ND Concept Study workshop	ND	2	Mar-17	Mar-17
20	Jun-17	Define two/three ND concept options for further study	ND	2	May-17	May-17
16	Jun-17	ND Concept Study workshop	ND	2	Jul-17	Jun-17
69	Nov-17	ND Concept Study workshop (CERN)	ND	4	Nov-17	
73	Nov-17	Document criteria/physics processes for ND tracker choice	ND	3	Nov-17	
74	Nov-17	Document criteria for comparison of magnet options	ND	3	Nov-17	
77	Dec-17	Report on cost implications/technical risks of Selenoid option	ND	3	Dec-17	
85	Jan-18	Status report on ND tracker studies - define next steps	ND	3	Jan-18	
86	Jan-18	Recommendation on whether to pursue PRISM concept	ND	2	Jan-18	
87	Jan-18	Report on scientific arguments for magnet to EC	ND	3	Jan-18	
89	Feb-18	Decision on ND Magnet	ND	2	Feb-18	
91	Mar-18	Report on comparison of tracker options and recommendation	ND	3	Mar-18	
92	Mar-18	Report on benefits of PRISM concept and recommendation	ND	3	Mar-18	
93	Mar-18	Report on benefits of 3-D scintillator as part of MPT and recommendation	ND	3	Mar-18	
94	Mar-18	ND Concept Study workshop	ND	4	Mar-18	
97	Apr-18	Decision on PRISM concept	ND	2	Apr-18	
98	Apr-18	Decision on 3-D scintillator	ND	2	Apr-18	
99	Apr-18	Decision on ND Tracker technology	ND	2	Apr-18	
201	May-18	Decision on the conceptual design of the near detector systems	ND	1	Dec-17	
204	Jun-18	Start of ND EoI process	ND	2	Jan-18	
124	Apr-19	Draft of CDR for Near Detector	ND	2	Sep-18	
130	Aug-19	Review of Near Detector CDR	ND	1	Aug-19	
135	Apr-20	TDR for Near Detector	ND	1	Apr-20	
134	Jun-20	LBNC Review of Near Detector TDR	ND	1	Jun-20	
137	Aug-20	CD-3 and LBNC Reviews for near site and Near Detector	ND	1	Aug-20	

## Findings and Plans Charge and Actions

3rd DUNE ND Workshop  
 CERN, 6-Nov-2017

Kam-Biu Luk, Alfons Weber  
 Mike Kordosky, Steven Manly

The **CENF-ND forum** is set to provide **support** to the ongoing efforts of the **DUNE** and **HK** collaborations, strength the European support, attract new institutes, endorse participation from Japanese and American Institutes.

The effort started in July and growing up. 1 steering group and 5 Working Groups

**Steering group:** P. Sala (CERN/INFN-Mi), S. Bordoni (CERN), A. Weber (U. Oxford/RAL), M. Zito (CEA, Paris)

**WG1** - Flux: M. Diwan (BNL), B. Popov (LPNHE, Paris)

**WG2** - Cross-section (TH): M. Martini (CEA,Paris), F. Sanchez (IFAE, Barcelona)

**WG3** - Cross-section (Exp): S. Bolognesi (CEA,Paris), TBD (expected from LAr community)

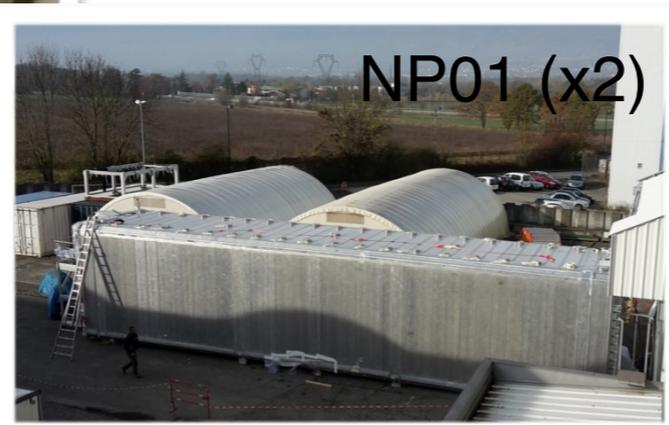

**WG4** - Sensitivity studies: L. H. Whitehead (CERN), D. Meloni (Roma 3)

**WG5** - R&D: E. Radicioni (INFN-Ba), T. Lux (IFAE, Barcelona)

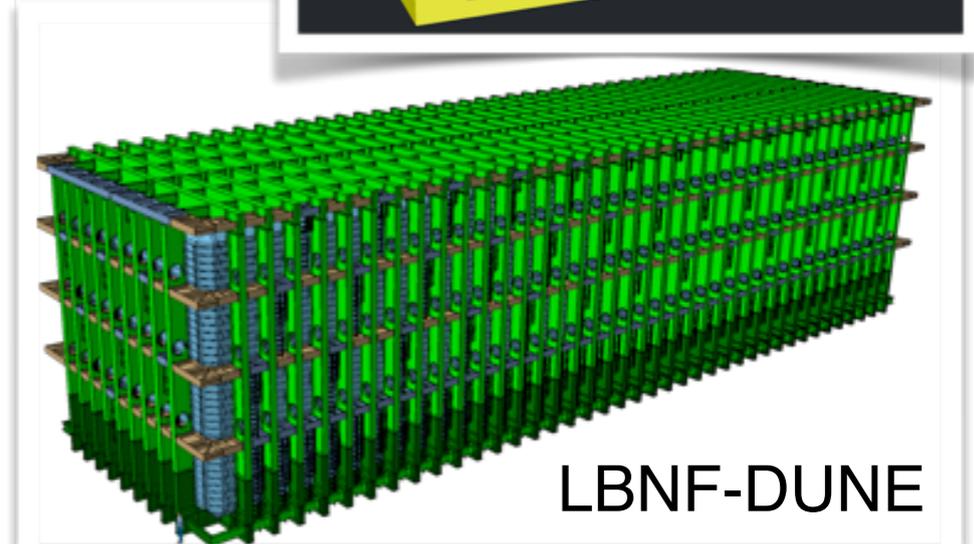

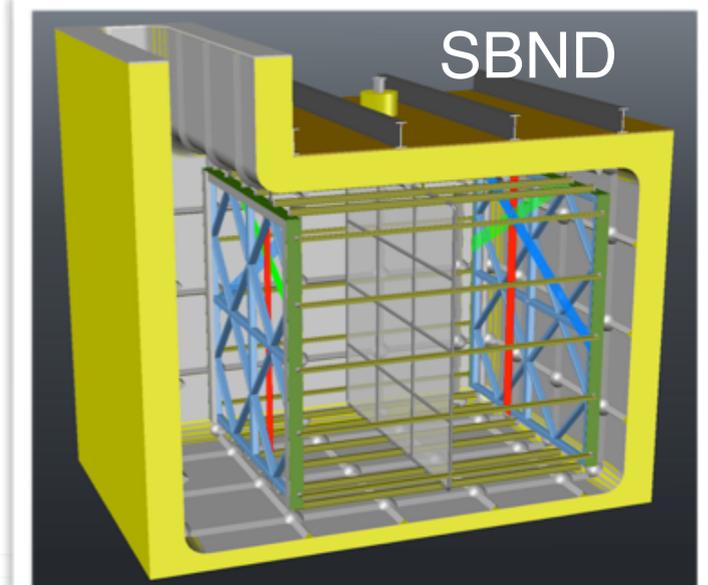

Convenors from both T2K and DUNE and in connection with NA61/SHINE and NuSTEC

# Recap on cryostats

Design phase

# LBNF-DUNE

Warm structure final review done and ok:

- Final warm structure design
- Drawings and models repository
- Detailed structural analysis
- Plans for destructive tests and QA
- Analysis of installations scenarios
- Requirements on tools and infrastructure
- Requirements on host lab responsibilities
- Access, safety and construction codes aspects

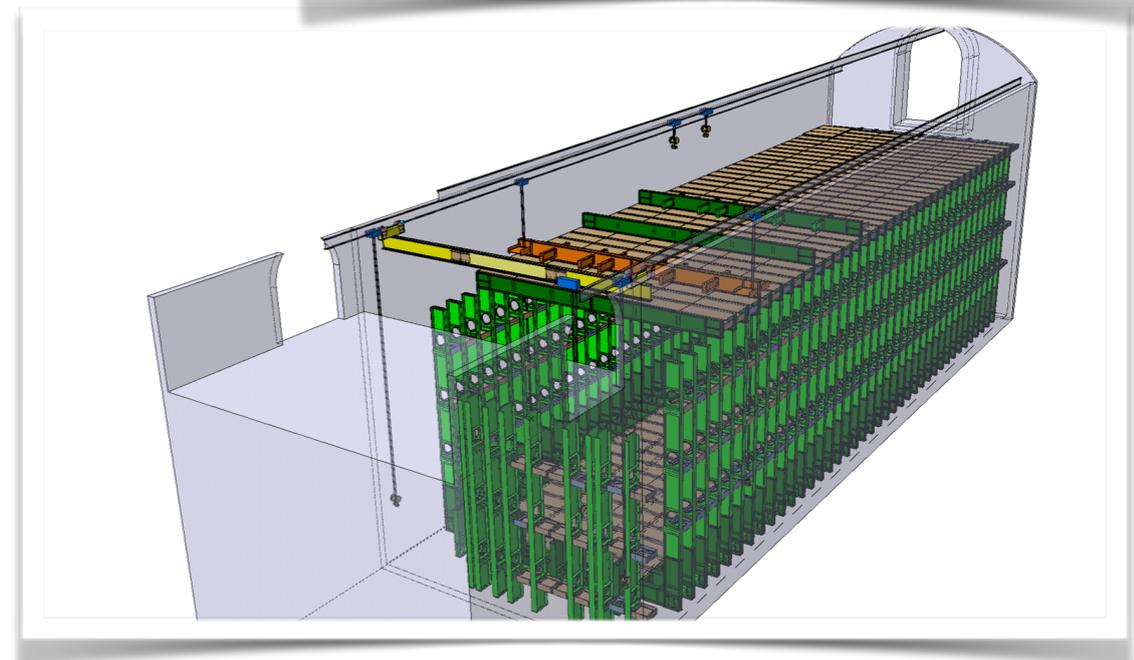

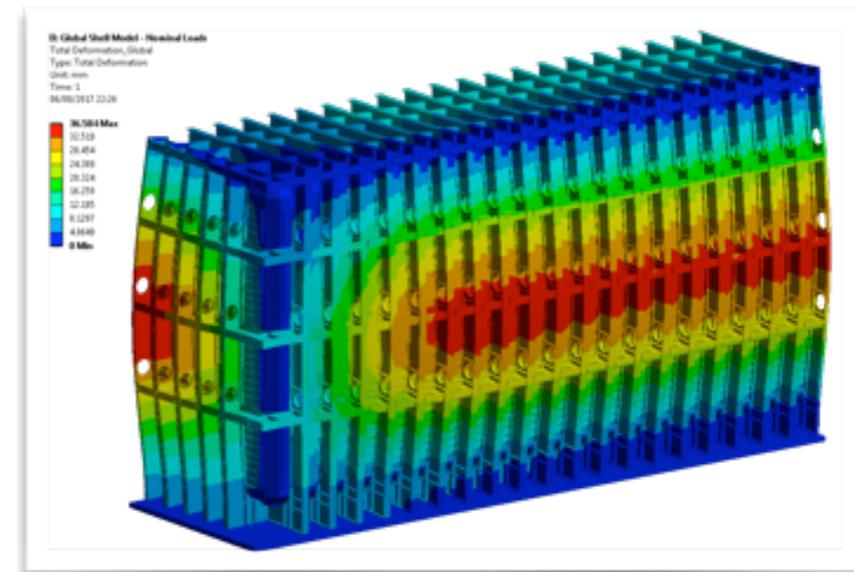

CERN approved to issue a Design Contract with GTT  
Contract should be ready before end of 2017.

Design work in 2018 with following deliverables:

- Cold vessel final design
- Table of materials to be ordered
- Detailed installation procedure
- Structural and thermal analysis
- QA plans
- List of firms to be contracted for the execution
- Overall schedule compatible with start of installation at SURF in 2021

Warm structure Final Design review  
at SURF on 21-22 August 2017

# Conclusions

The CERN Neutrino Platform is very active on several fronts.

NP offers to the neutrino community support for detector R&D, tests and construction for both US and Japanese activities.

At EHN1 extension two LAr TPC prototypes for LBNF-DUNE will be operated on a charge particle test beam starting from next year.

NP is involved in installation and commissioning of LAr detectors in Europe and in US.

NP has major responsibility towards cryostats. The first LBNF cryostat should be ready for installation by end of 2020.

CERN is also strongly committed to the FNAL short baseline program.

More activities to assist DUNE and T2K/HK in the definition of their future near detector are being planned.
