

High energy photons detection with the Alpha Magnetic Spectrometer on the ISS

Sonia Natale
University of Geneva

February 28 - March 1, 2002

Meeting of the SPS - EPFL, Switzerland

- ❖ ISS and AMS-02
- ❖ The detector
- ❖ Gamma astrophysics
- ❖ AMS-02 expected performances
- ❖ Conclusions

Outline:

High energy photons detection with
the Alpha Magnetic Spectrometer
on the ISS

What is AMS ?

Alpha Magnetic Spectrometer

A large acceptance magnetic spectrometer on the ISS

❖ Orbital parameters of ISS:

- *Orbital period* $\sim 92min$
- *Mean altitude* $\sim 382km$
- *Inclination* $\sim 51.6^\circ$

❖ Main physics topics:

- *dark matter*
- *antimatter*
- *origin and transport of cosmic rays*
detected through charged particles.
- *Study of γ -ray from galactic and extragalactic sources*

Sonia Natale

AMS-02 Superconducting Magnet

12 racetrack coils + 2 dipole coils
2500 liters of superfluid helium
 $BL^2 = 0.86 Tm^2$

(page 5)

AMS-02 Silicon Tracker

8 layers of double sided silicon sensors
 $6.5\text{m}^2 \rightarrow 192$ Ladders $\rightarrow 196k$ channels
 $\sigma(p)/p = 1.5\%$ @ 10 GeV
max detec. rigidity = 2.6 TV

(page 6)

February 28 - March 1, 2002

AMS-02 Electromagnetic Calorimeter

9 super layers of Sci-Fi/Lead ($15 X_0$)
(324 multianode PMTs)

$$\sigma(E)/E = 3 \% @ 100 \text{ GeV}$$

(p/e rejection of 10^3)

γ -Ray Universe

~ 280 pointlike γ -ray sources detected by EGRET (variable sources, transients)

- ◆ ~ 70 Active Galactic Nuclei (AGNs)
- ◆ ~ 7 Pulsars
- ◆ ~ 200 sources not identified by an astronomical object

How are γ -rays produced ?

◆ Need powerful ENGINES!

→ *astronomical objects supplying energy*

- Star explosions
- Rotational energy
- Accretion energy
- Magnetic energy

◆ Need efficient ACCELERATION!

→ *charged particles*

- Electromagnetic
- Shock waves

Need “right” ENVIRONMENTS!

→ *γ s production*

- Synchrotron radiation
- Inverse Compton
- π^0 -production

How are γ -rays produced ?

Galactic sources:

Pulsars

Rotating neutron stars from supernovae remnants, for which the axis of rotation is misaligned with the magnetic axis.

- Fields at the surface liberate e^- , e^+ , p which are then accelerated by the magnetosphere.

Carroll & Ostlie 1996

How are γ -rays produced ?

Extragalactic sources:

AGNs

- Very massive rotating black hole surrounded by its accretion disk and by a giant torus of gas and dust.
- Jets of particles are ejected along the rotation axis and confined by the magnetic fields generated from the accretion disk.

- Particle acceleration can occur by shock waves.

Urry & Padovani 1995

- When the jet points towards Earth the object is called *blazar*.

3 fundamental needs of γ -ray astrophysics

Imaging & Field of Obs.

$$(\theta \sim 0.017 \rightarrow 0.17^\circ)$$

$$(\Omega \sim \pi)$$

Absolute Timing ($1 \rightarrow 10\mu s$)

Absolute Orient.: *Star Tracker*

γ detection with AMS-02

Conversion Mode

Calorimetric Mode

High energy photons detection with
the Alpha Magnetic Spectrometer
on the ISS

Sonia Natale

February 28 - March 1, 2002

Tracker performances

Energy range 1 – 100 GeV
E resolution 3 % @ 10 GeV
 Θ resolution 0.04° @ 10 GeV

Calorimeter performances

Energy range 10 – 1000 GeV
 E resolution 3 % @ 100 GeV
 Θ resolution 0.5° @ 100 GeV

Signal estimate from Galactic sources

Calorimeter

Tracker

- ❖ Estimate based on accurate orbit and attitude model.
- ❖ Rough estimate of reconstruction efficiency.
- ❖ Sufficient rate for regular observation.
- ❖ Long observation period.
- ❖ Enlarged energy interval.
- ❖ Complementary to satellite and ground based experiments.

Conclusions

- ❖ **AMS-02** is approved by NASA to operate on the ISS for 3 years.
- ❖ **AMS-02** will be ready to fly in the beginning of 2005.
- ❖ **AMS-02** large acceptance and long exposure time will allow an unprecedented sensitive study of Cosmic Rays.
- ❖ Interesting Galactic and Extragalactic source measurements can be made.
- ❖ **AMS-02** γ -sensitivity lies in between EGRET and GLAST experiments.

AMS-02 Time of Flight System

4 planes + 12 scintillator paddles
(seen by 2 PMTs on each side)

$$\sigma(\beta)/\beta = 3.7 \% @ \beta = 1 \text{ (protons)}$$

High energy photons detection with
the Alpha Magnetic Spectrometer
on the ISS

February 28 - March 1, 2002

AMS-02 Transition Radiation Detector

Top 4 layers (measure y coordinate), 12 layers (x), 4 layers (y)
y01K142b Figure 1 46

y02K03aAachen

20 layers of TRD
5248 straw tubes

h/e rejection of $10^2 - 10^3$
(in the range 3 – 300 GeV)

AMS-02 Ring Imaging Cerenkov Counter

3 cm silica aerogel ($n = 1.05$) radiator
680 multianode PMTs

$$\sigma(\beta)/\beta = 0.1 \% @ \beta = 1 \text{ (protons)}$$
