

THE QUEST FOR LIGHT NEW PHYSICS

JURE ZUPAN
U. OF CINCINNATI

seminar, U. Geneva, May 10 2022

THE GOAL OF PARTICLE PHYSICS

THE GOAL OF PARTICLE PHYSICS

$$\mathcal{L} = ?$$

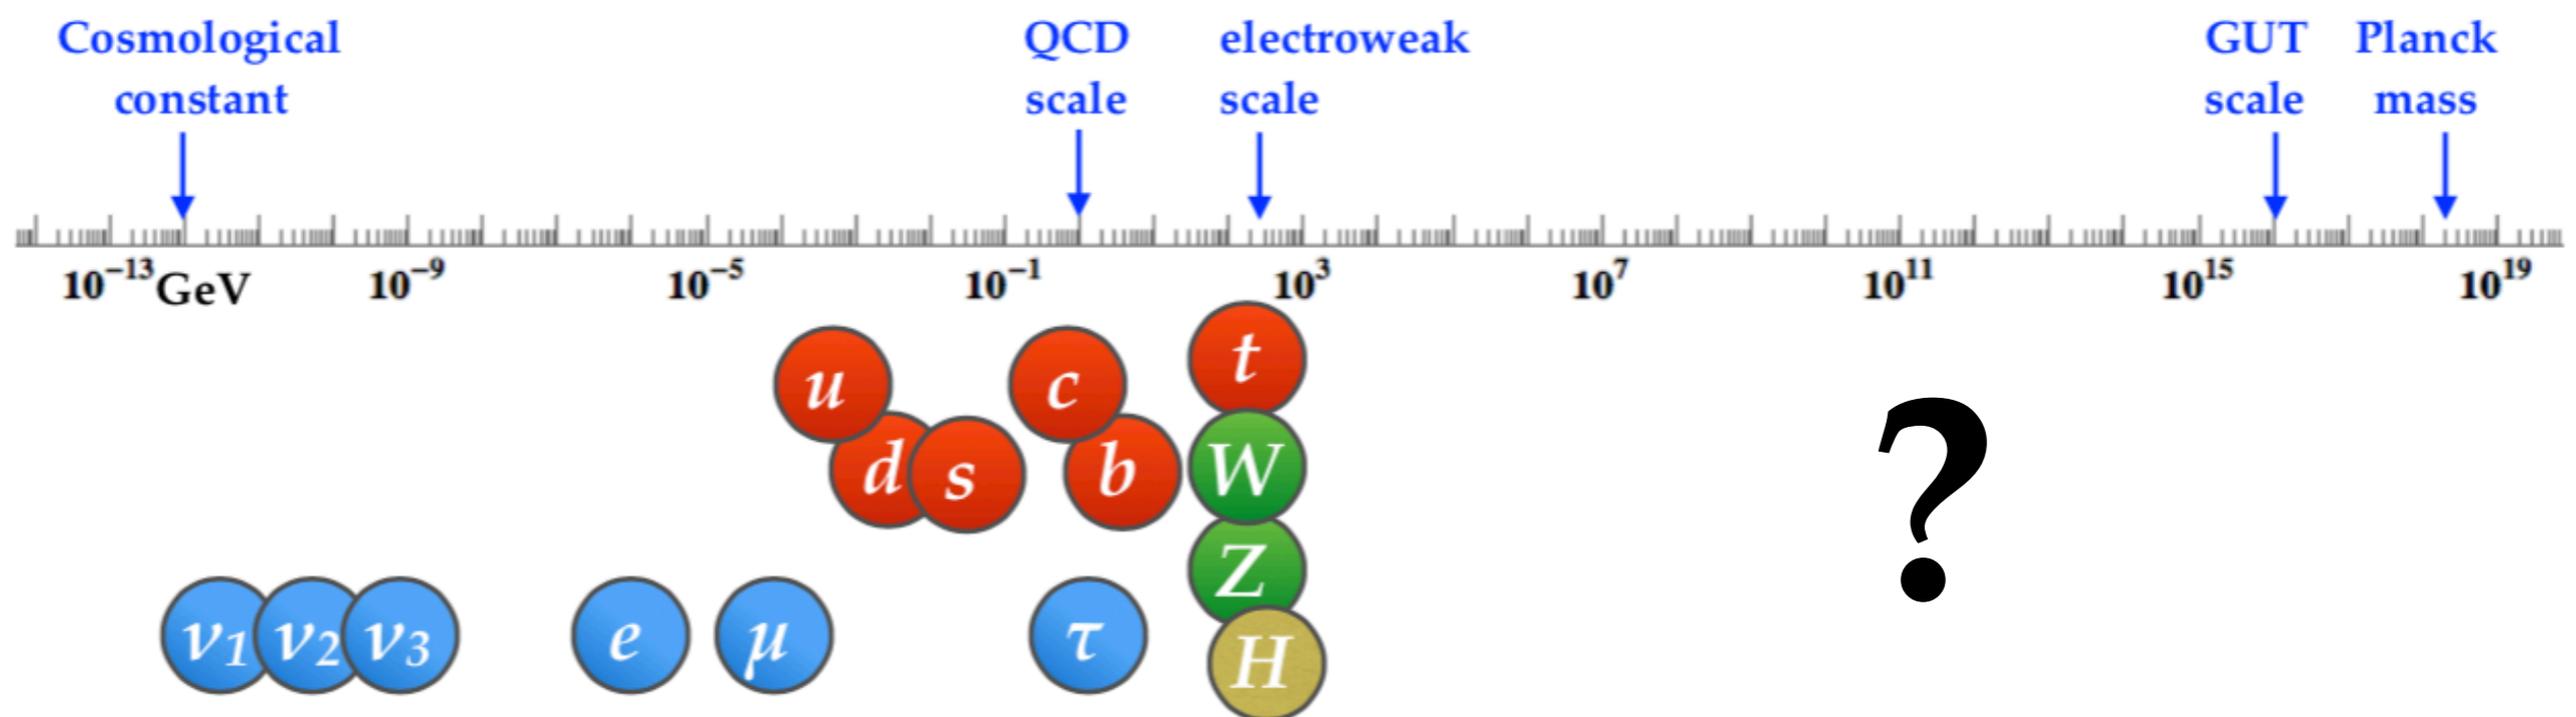

THE GOAL OF PARTICLE PHYSICS

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + ?$$

- to answer need to find
 - field content (particles)
 - interactions

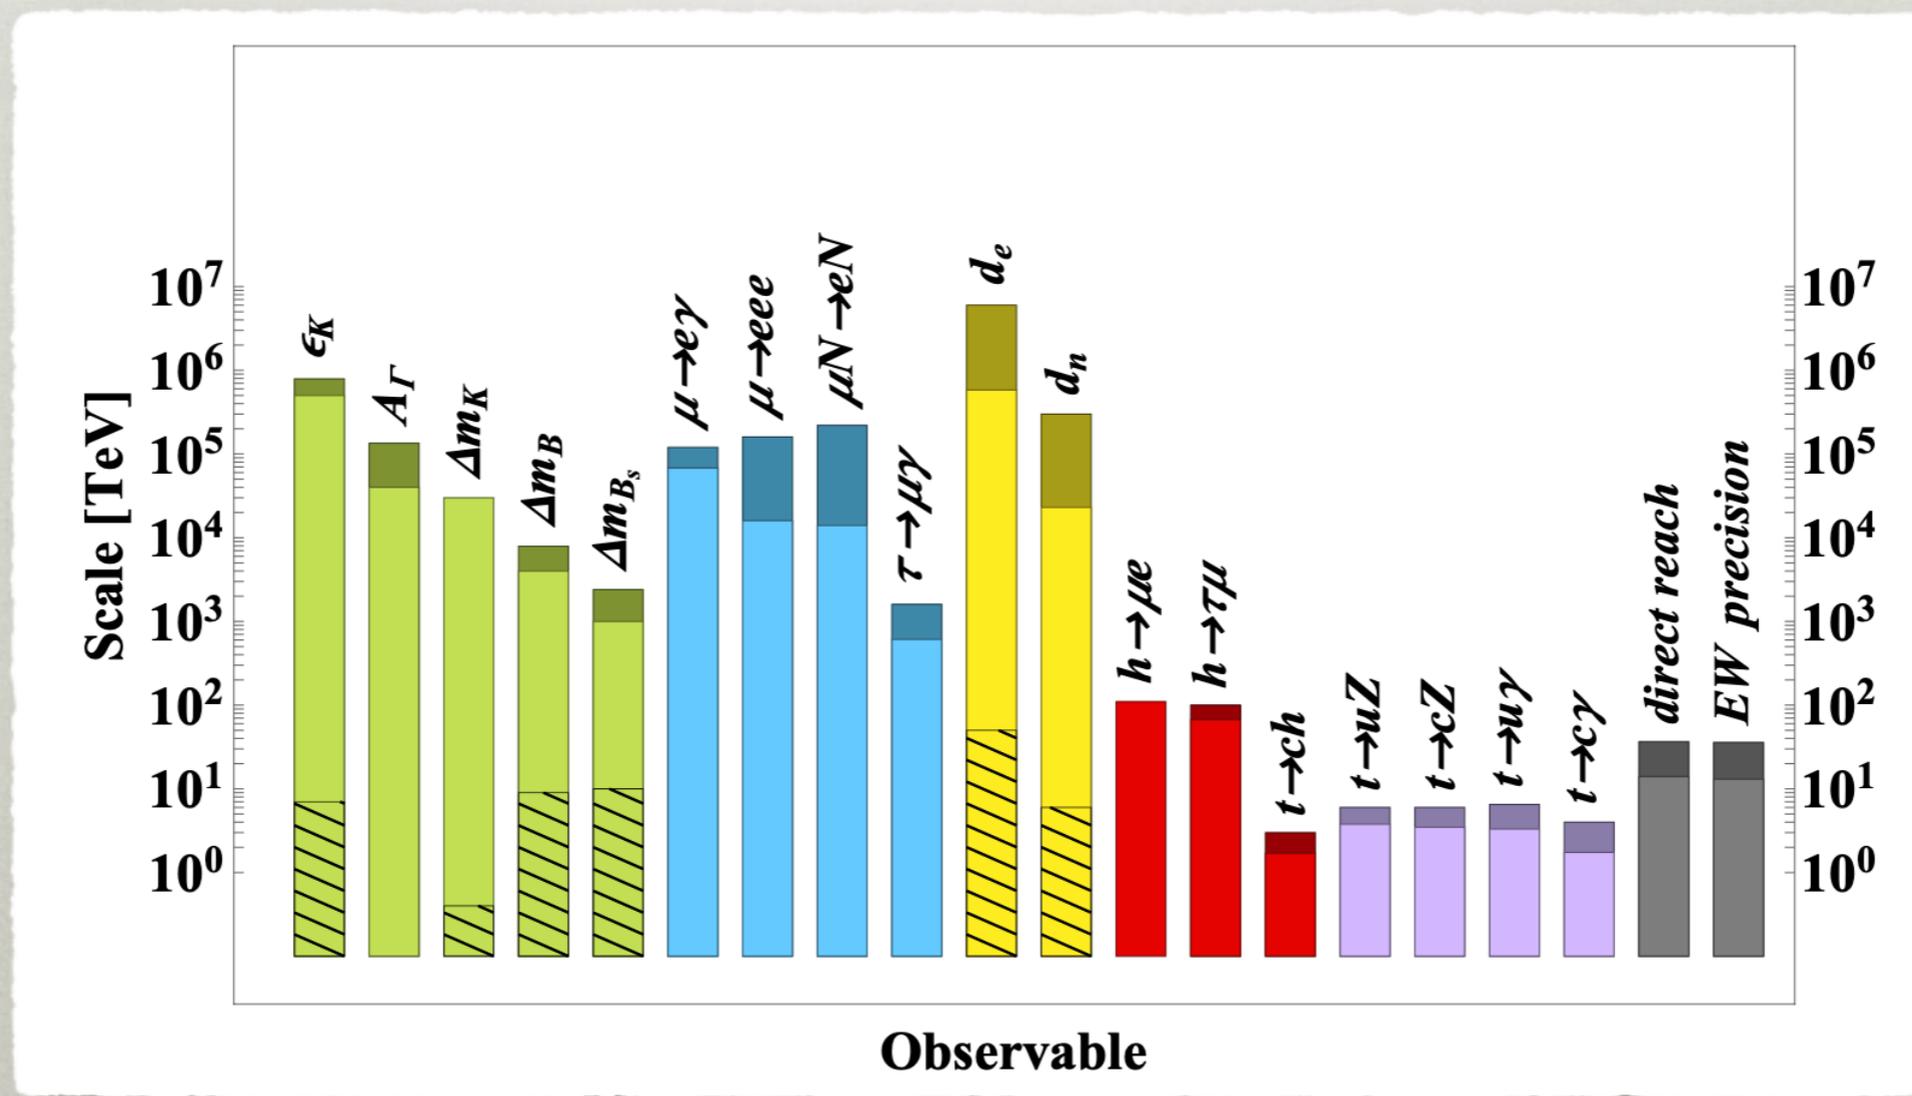

NEW PHYSICS?

- SM is not complete
 - no viable dark matter candidate in the SM
- also other puzzles
 - how tuned is the weak scale (hierarchy problem)
 - baryogenesis
 - any dynamical explanation for flavor structure...

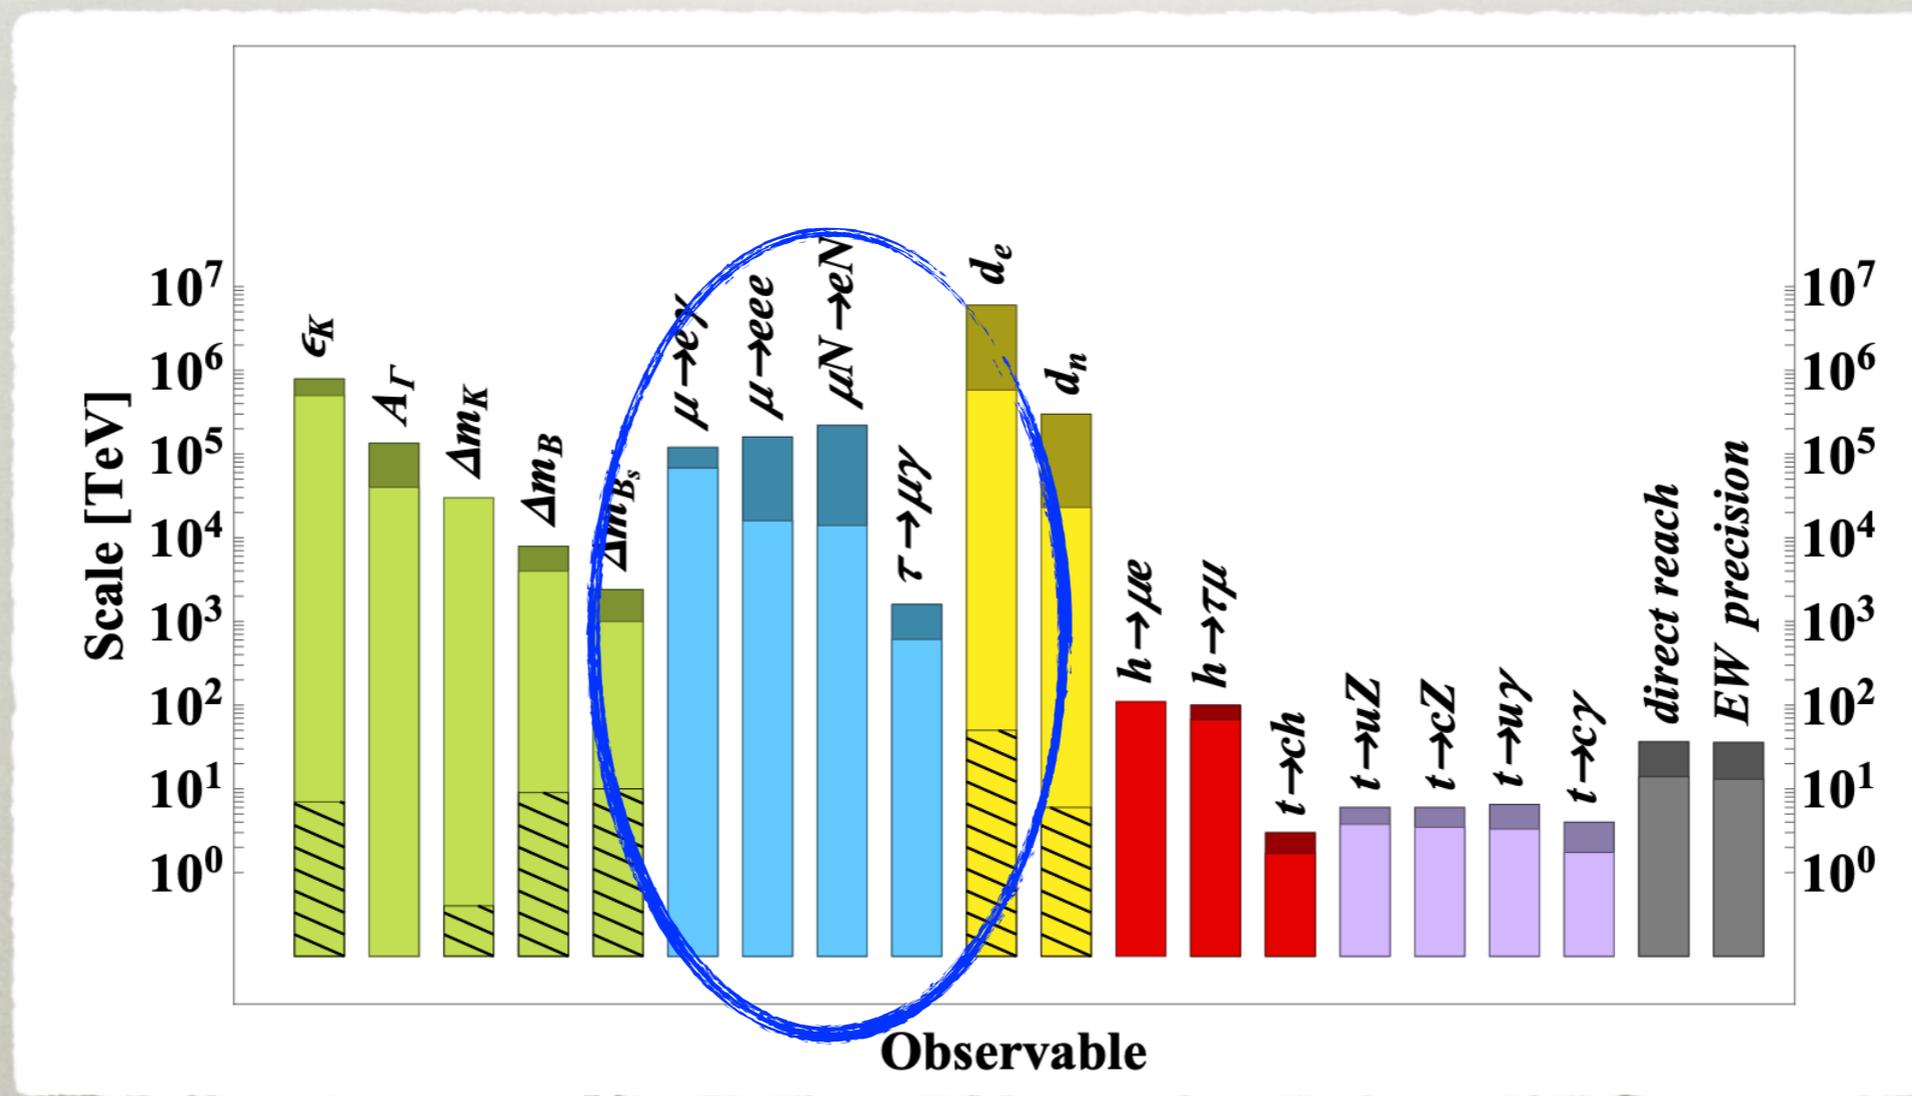

SEARCHING FOR NEW PHYSICS

- direct and indirect probes

SEARCHING FOR NEW PHYSICS

- direct and indirect probes

SUMMARY OF CLFV

- heavy NP, integrate out
 - matches onto SMEFT
- in the examples switched on only two sets of ops.*

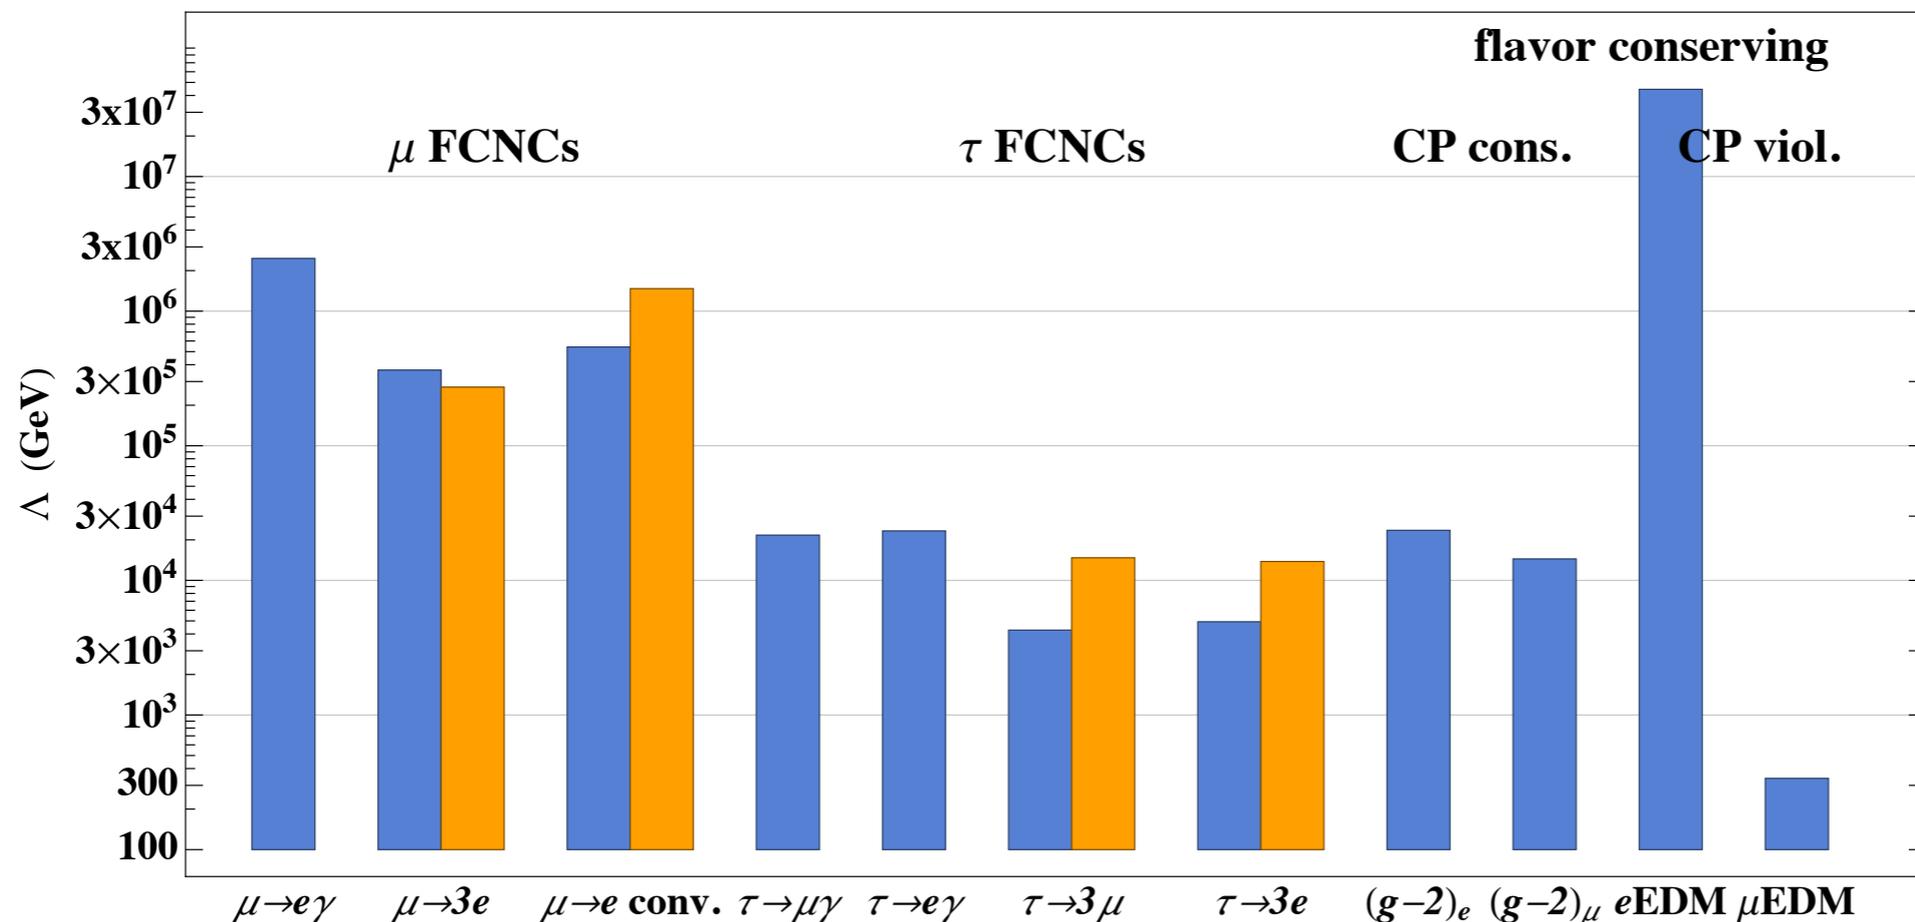

$$\mathcal{L} = \sum_a \frac{C_a}{\Lambda^2} Q_a$$

$$Q_\gamma^{ij} = \frac{e}{8\pi^2} H(\bar{\ell}^i \sigma^{\mu\nu} P_L \ell^j) F_{\mu\nu}$$

$$Q_{4 \text{ ferm.}}^{ijkl} = (\bar{\ell}^i \gamma^\mu \ell^j)(\bar{f}^k \gamma_\mu f^l)$$

max. flavor violation

■ dipole op. ■ 4-fermion op.

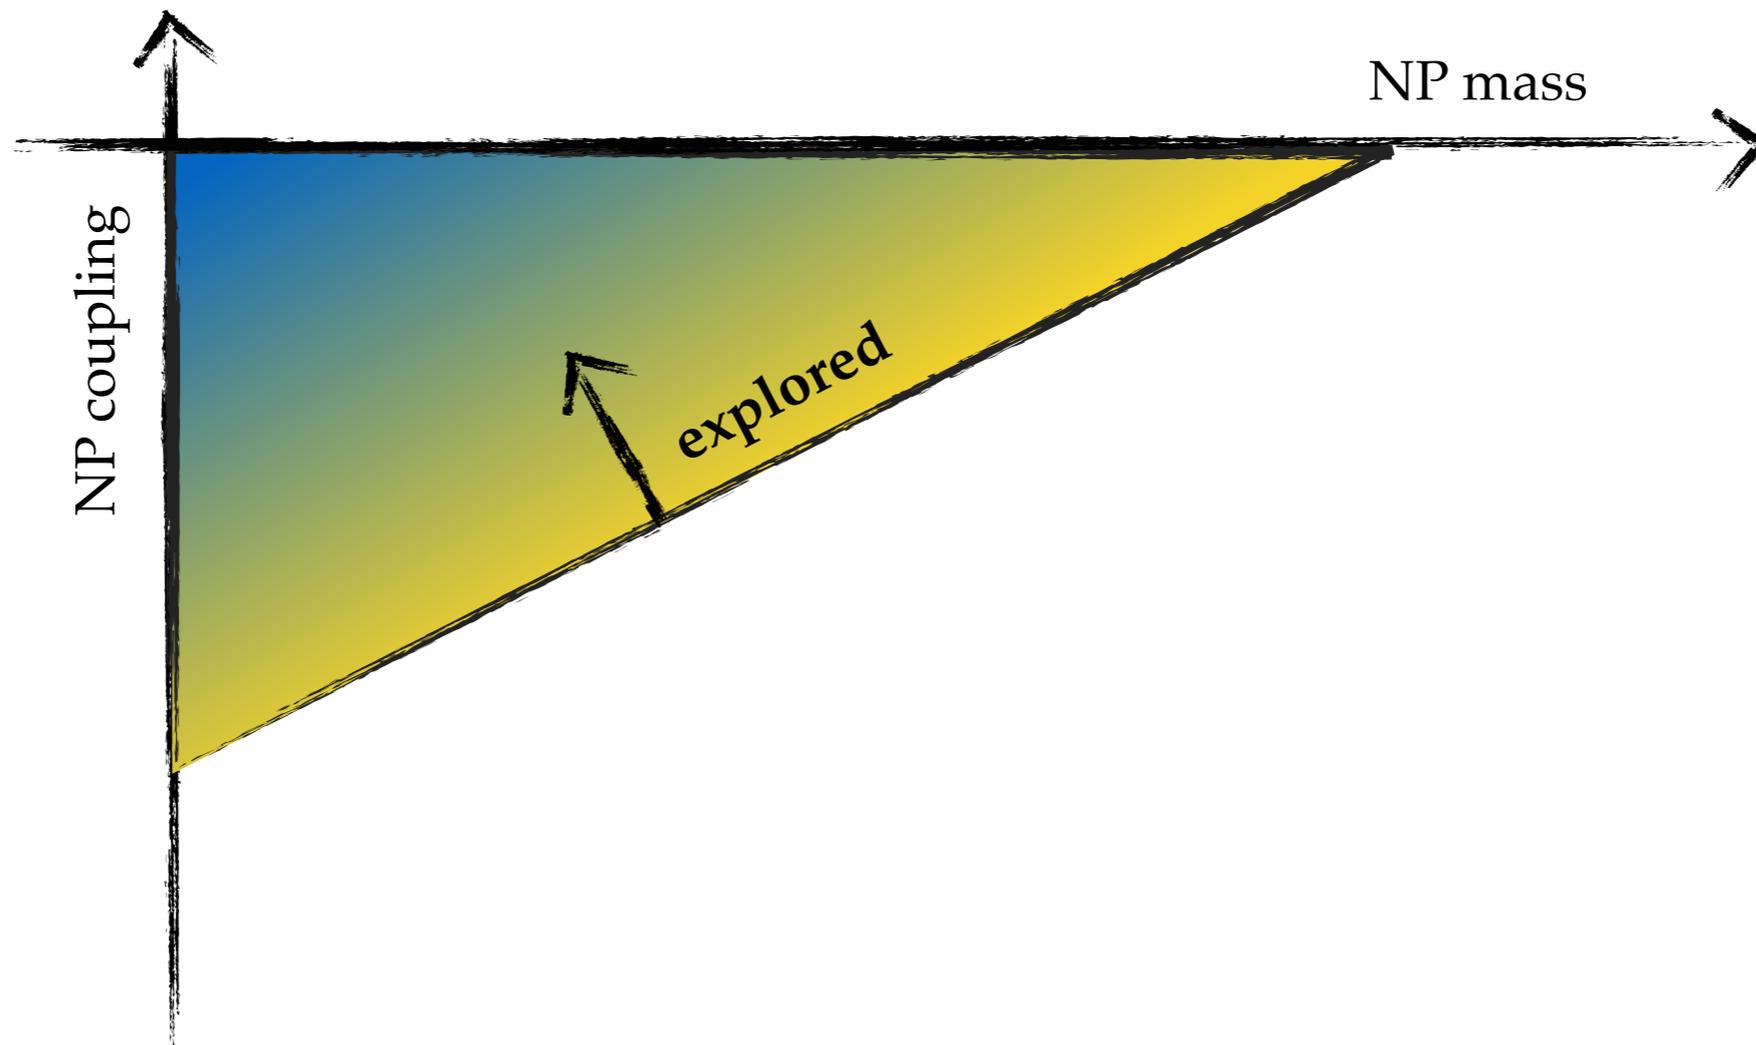

*in bounds either $C_a=1$ or $C_a=i$

** $(g-2)_\mu$ and $(g-2)_e$ interpreted as bounds

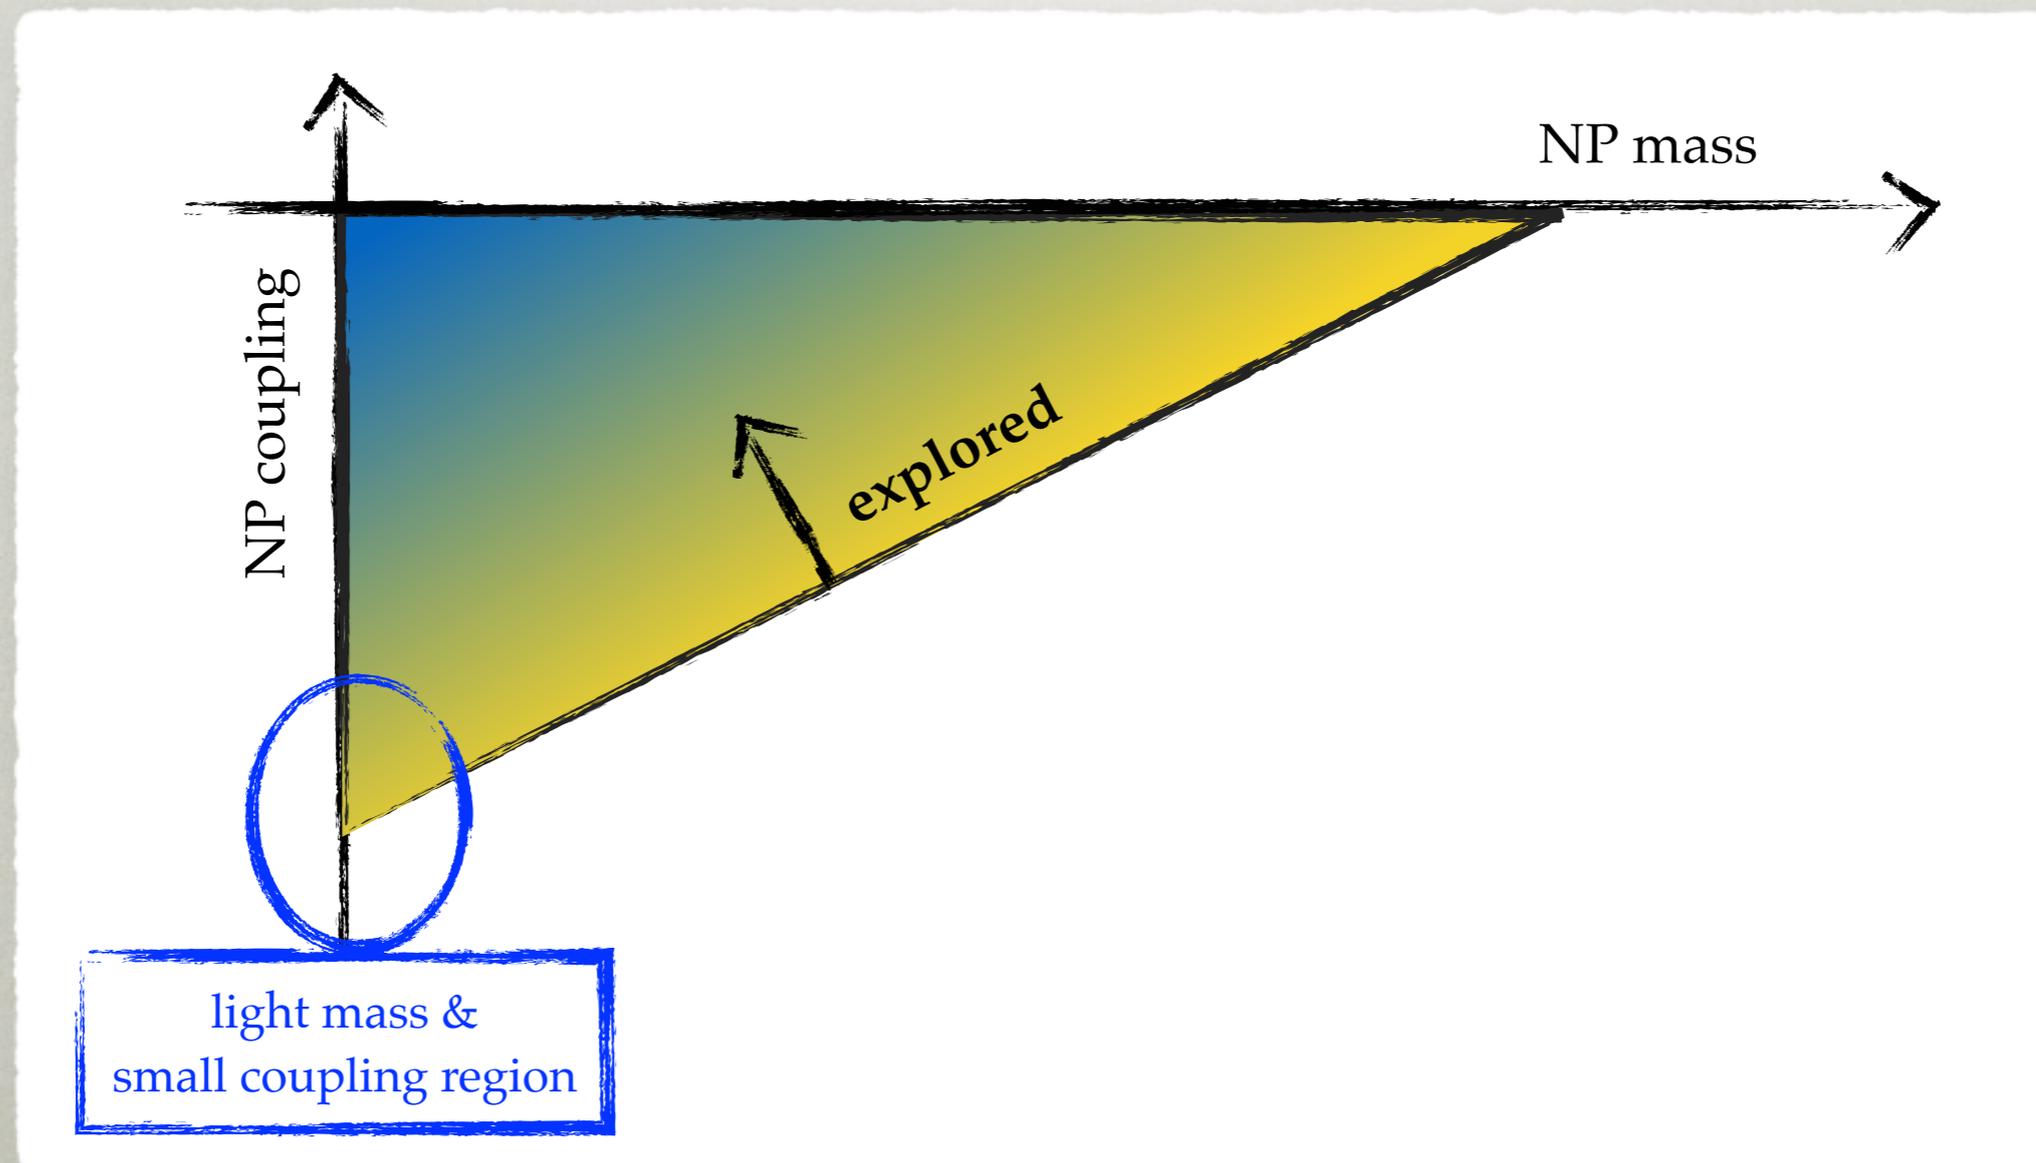

THE LAY OF THE LAND

- explored only part of the NP parameter space
- light particles: a window to high UV dynamics

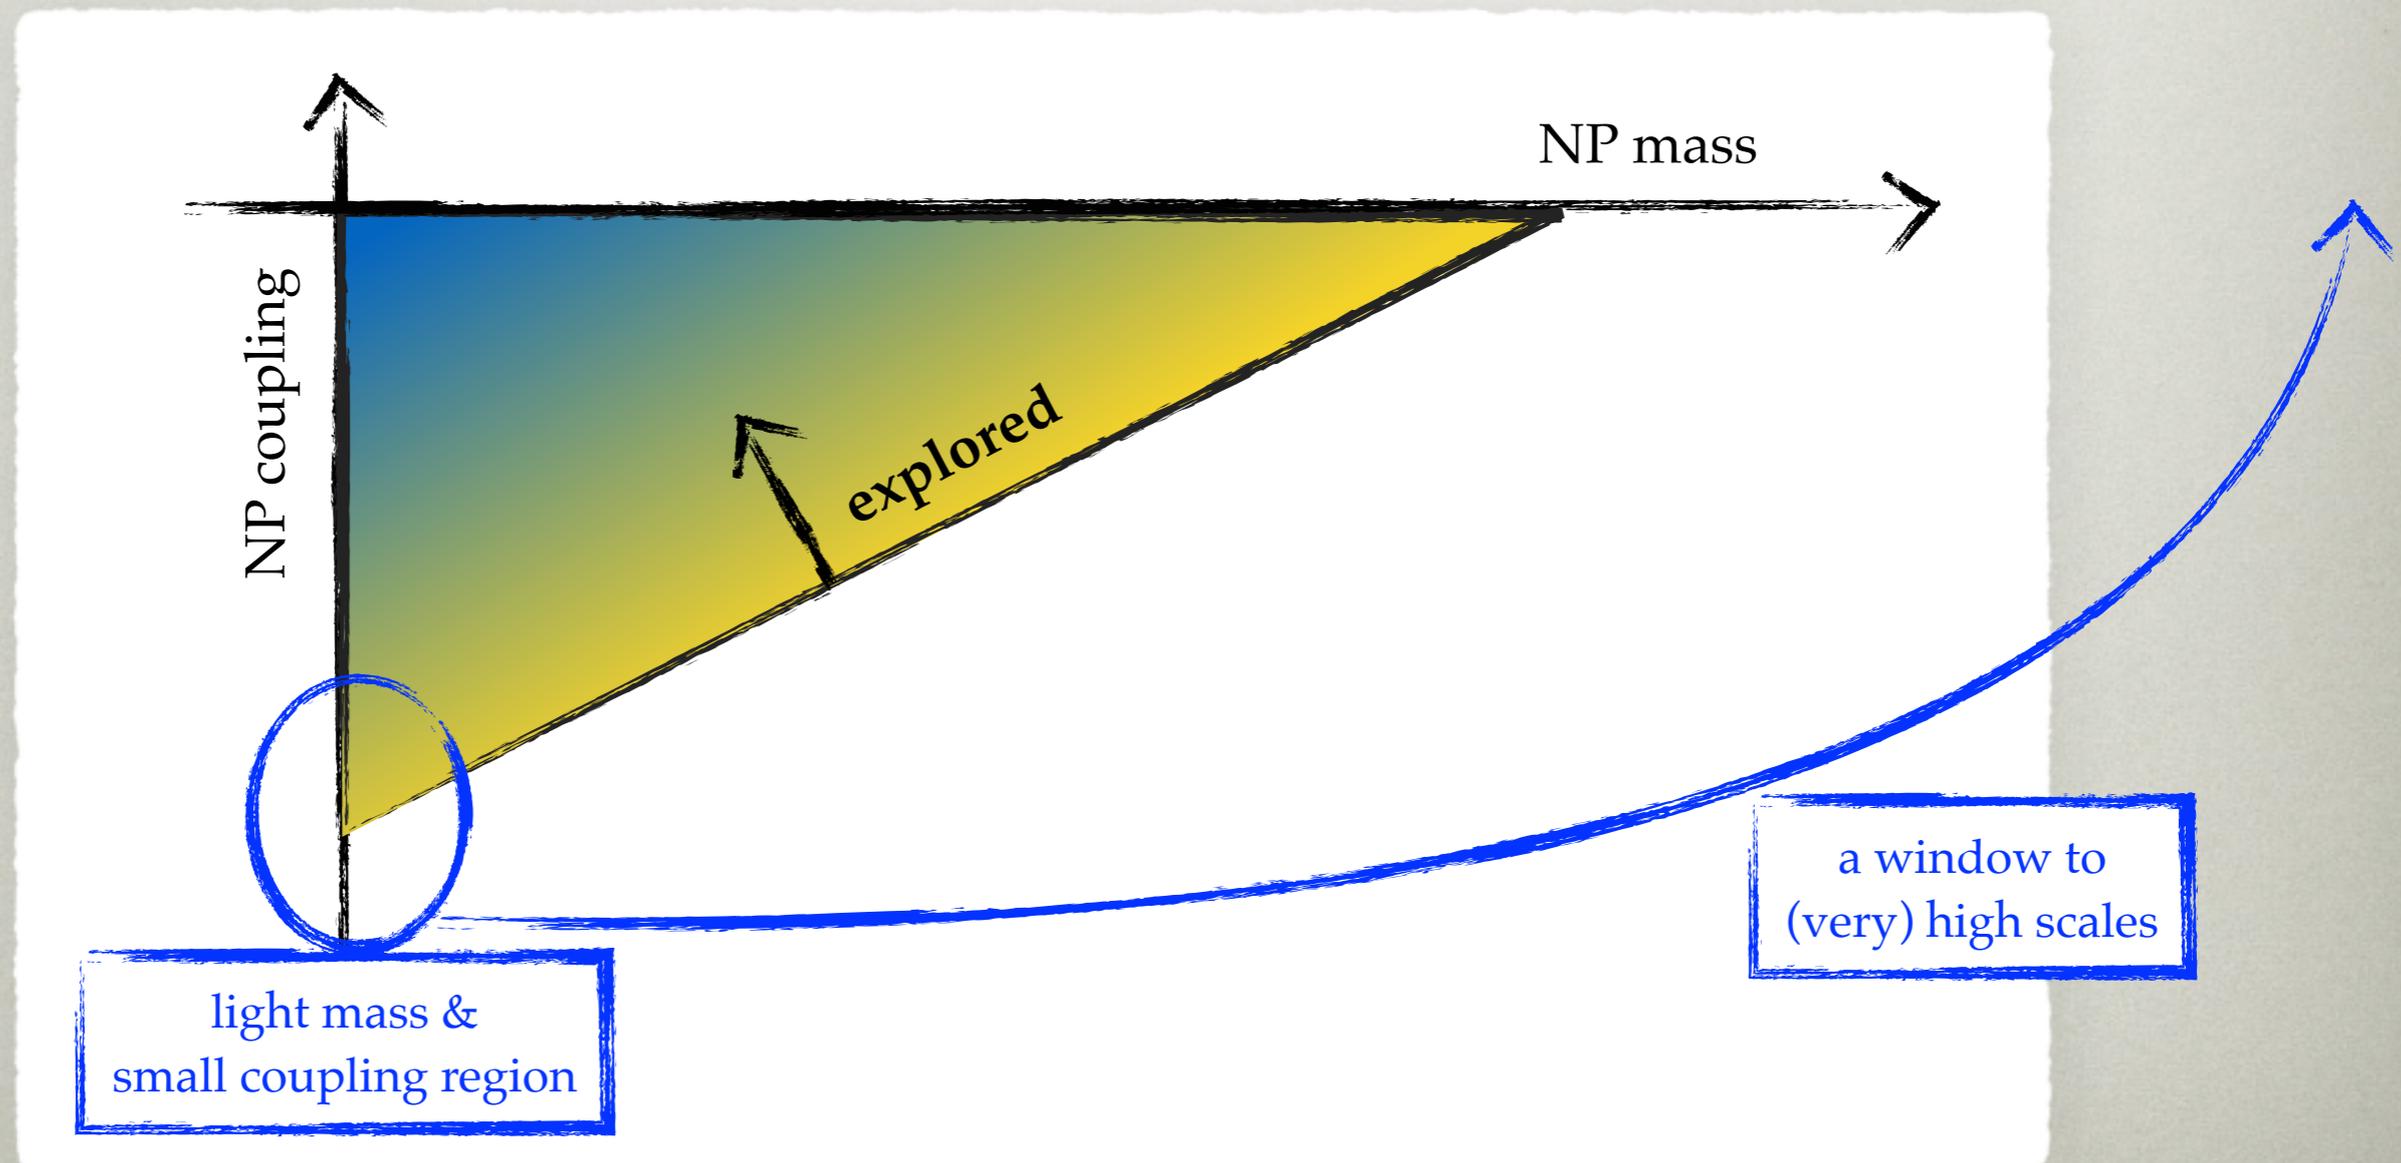

THE LAY OF THE LAND

- explored only part of the NP parameter space
- light particles: a window to high UV dynamics

THE LAY OF THE LAND

- explored only part of the NP parameter space
- light particles: a window to high UV dynamics

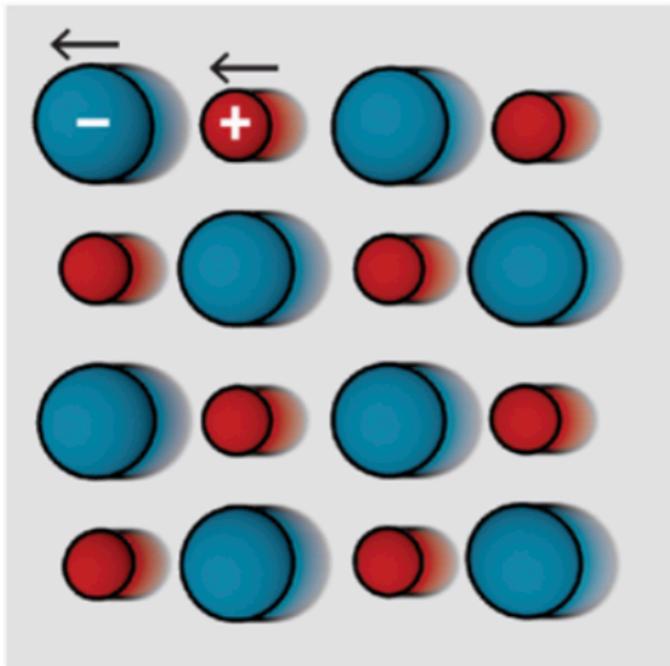

LIGHT NEW PARTICLES

- how generic are light new particles?
- any spontaneously broken global symmetry
 - \Rightarrow massless Nambu-Goldstone boson

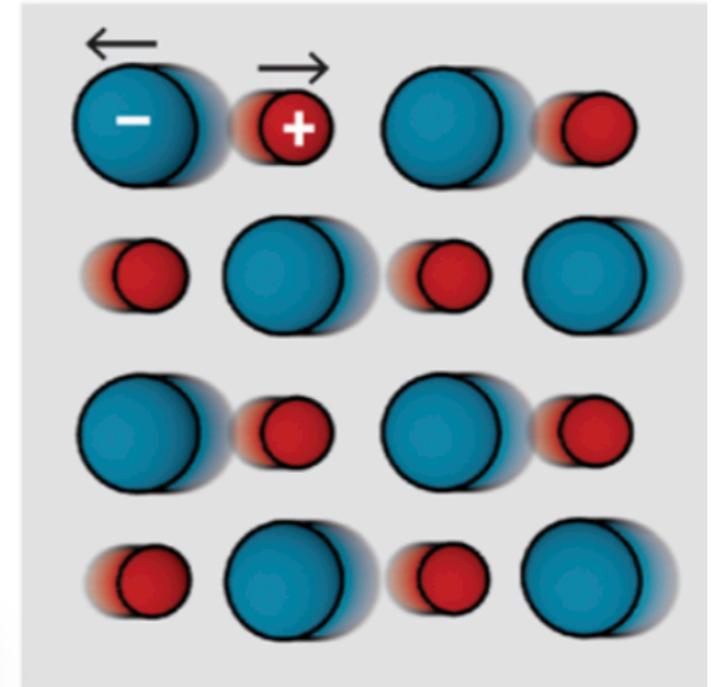

EXAMPLE: PHONONS

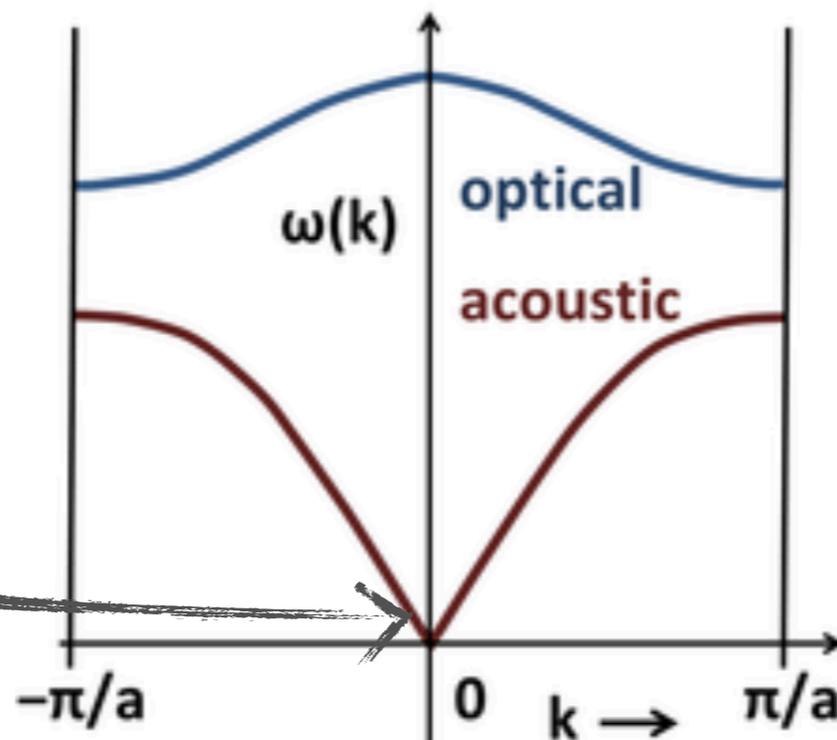

Acoustic Phonons

Optical Phonons

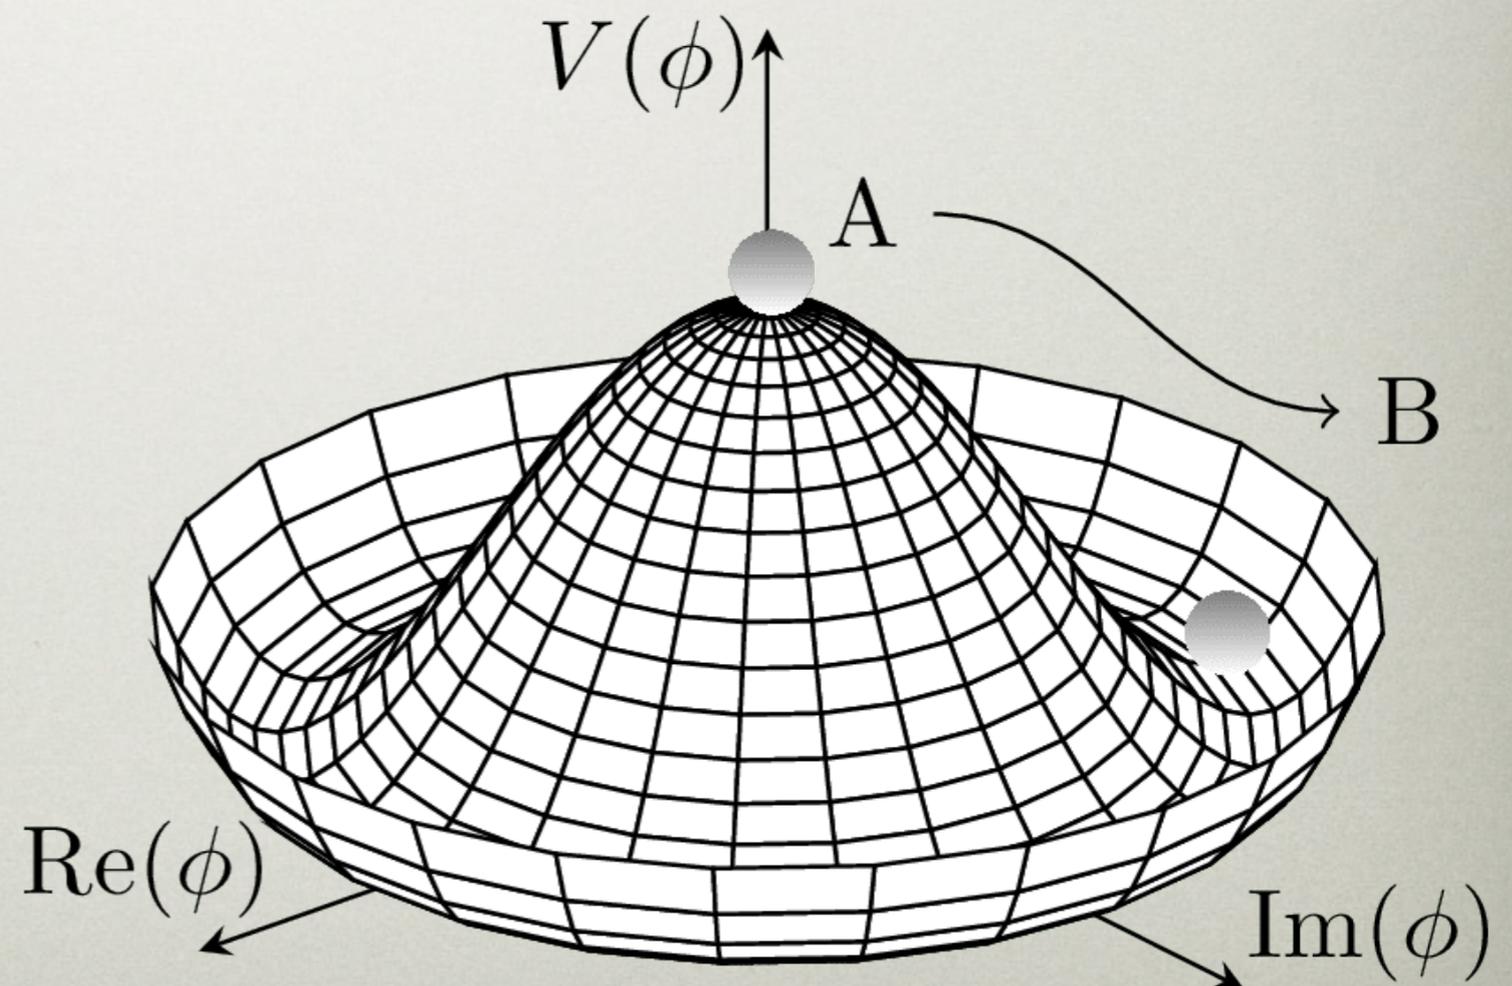

$$\omega = c_s k$$

EXAMPLE: $U(1)$ HIGGS MECHANISM

- a global $U(1)$ spontaneously broken by a scalar vev

$$\Phi = \frac{f + \phi(x)}{\sqrt{2}} e^{ia(x)/f}$$

QCD AXION

- a celebrated example: QCD axion

STRONG CP PROBLEM

- Lorentz and gauge invariance allow a CP violating term in QCD

$$\mathcal{L} = \theta \frac{\alpha_s}{8\pi} G_a^{\mu\nu} \tilde{G}_{a,\mu\nu} = \theta \frac{\alpha_s}{16\pi} \epsilon_{\mu\nu\rho\sigma} G_a^{\mu\nu} G_a^{\rho\sigma}$$

- physically observable is the combination

$$\bar{\theta} \equiv \theta + \arg \det(\mathcal{M}_u \mathcal{M}_d)$$

- experimentally :

$$d_n \approx 4 \times 10^{-16} \bar{\theta} \text{ e cm} \quad \longleftrightarrow \quad |d_n|_{\text{exp}} < 3 \times 10^{-26} \text{ e cm}$$

- why $\bar{\theta}$ so small?

$$\bar{\theta} < 10^{-10}$$

- very puzzling given large CPV phase in the CKM

AXION

- if $\bar{\theta}(x)$ a dynamical field and couples only to $\bar{\theta}G\tilde{G}$
 \Rightarrow potential min. at $\bar{\theta}(x) = 0$
- new ultra-light particle - axion

$$F_{f_i f_j}^{V,A} \equiv \frac{2f_a}{C_{f_i f_j}^{V,A}}$$

$$\mathcal{L}_{\text{eff}} = \frac{\alpha_s}{8\pi} \frac{a}{f_a} G\tilde{G} + \frac{E}{N} \frac{\alpha_{\text{em}}}{8\pi} \frac{a}{f_a} F\tilde{F} + \frac{\partial_\mu a}{2f_a} \bar{f}_i \gamma^\mu (C_{f_i f_j}^V + C_{f_i f_j}^A \gamma_5) f_j$$

- obtains mass from QCD anomaly

$$m_a = 5.70(7) \mu\text{eV} \left(\frac{10^{12} \text{ GeV}}{f_a} \right)$$

- viable cold dark matter candidate for

$$10^{-8} \text{ eV} \lesssim m_a \lesssim 10^{-3} \text{ eV}$$

PORTALS

Portal	Interactions
Dark Photon, A'_μ	$-\epsilon F'_{\mu\nu} B^{\mu\nu}$
Dark Higgs, S	$(\mu S + \lambda S^2) H^\dagger H$
Heavy Neutral Lepton, N	$y_N L H N$
Axion-like pseudo scalar, a	$a F \tilde{F} / f_a, a G \tilde{G} / f_a, (\bar{\psi} \gamma^\mu \gamma_5 \psi) \partial_\mu a / f_a$

LIGHT NEW PHYSICS \Rightarrow PROBE OF HIGH SCALES

- rare decays into a light state, X , e.g., $K \rightarrow \pi X$ or $\mu \rightarrow eX$,
 - exquisite probes of UV physics
- parametric gains compared to probing NP through dim-6 ops
 - the reason is that the SM decay widths are power suppressed $\Gamma_\ell \propto m_\ell^5/m_W^4$
- if light NP couples through dim 4 op with mixing angle $\theta \Rightarrow$
 $\Gamma(K \rightarrow \pi\varphi) \propto \theta^2 m_K \Rightarrow Br(K \rightarrow \pi\varphi) \propto \theta^2 (m_W/m_K)^4$
- if through dim 5 op. suppressed by $1/f_a \Rightarrow$
 $Br(\mu \rightarrow e\varphi) \propto (m_W^2/f_a m_\mu)^2$
- no such $1/m_\mu$ or $1/m_K$ enhancement for dimension 6 couplings
 $Br(\mu \rightarrow 3e) \propto (m_W/\Lambda)^4$

UPSHOT

- searching for $K \rightarrow \pi X, \mu \rightarrow e X, \tau \rightarrow \mu X$
decays expect to reach very high UV
scales

EXAMPLES

- two examples
 - flavor violating QCD axion
 - concrete example: axiflavoron
 - an axion-like particle (ALP) with lepton flavor violating couplings
 - gauged FN model of flavor
 - light Z'

MOTIVATION FOR LIGHT ALPs

- any spontaneously broken global symmetry \Rightarrow (p)NGB
 - if "light enough" can be DM
- in general couplings to gluons, photons, SM fermions

$$\mathcal{L}_{\text{eff}} = \frac{\alpha_s}{8\pi} \frac{a}{f_a} G\tilde{G} + \frac{E}{N} \frac{\alpha_{\text{em}}}{8\pi} \frac{a}{f_a} F\tilde{F} + \frac{\partial_\mu a}{2f_a} \bar{f}_i \gamma^\mu (C_{f_i f_j}^V + C_{f_i f_j}^A \gamma_5) f_j$$

$$F_{f_i f_j}^{V,A} \equiv \frac{2f_a}{C_{f_i f_j}^{V,A}}$$

$$F_{l_i l_j} = \frac{2f_a}{\sqrt{|C_{l_i l_j}^V|^2 + |C_{l_i l_j}^A|^2}}$$

- in general ALPs will have flavor violating couplings
 - do FCNC experiments probe interesting parameter space?
 - possible improvements on search strategies?

FLAVOR VIOLATING QCD AXION

FLAVOR VIOLATING QCD AXION

Martin Camalich, Pospelov, Vuong, Ziegler, JZ, 2002.04623

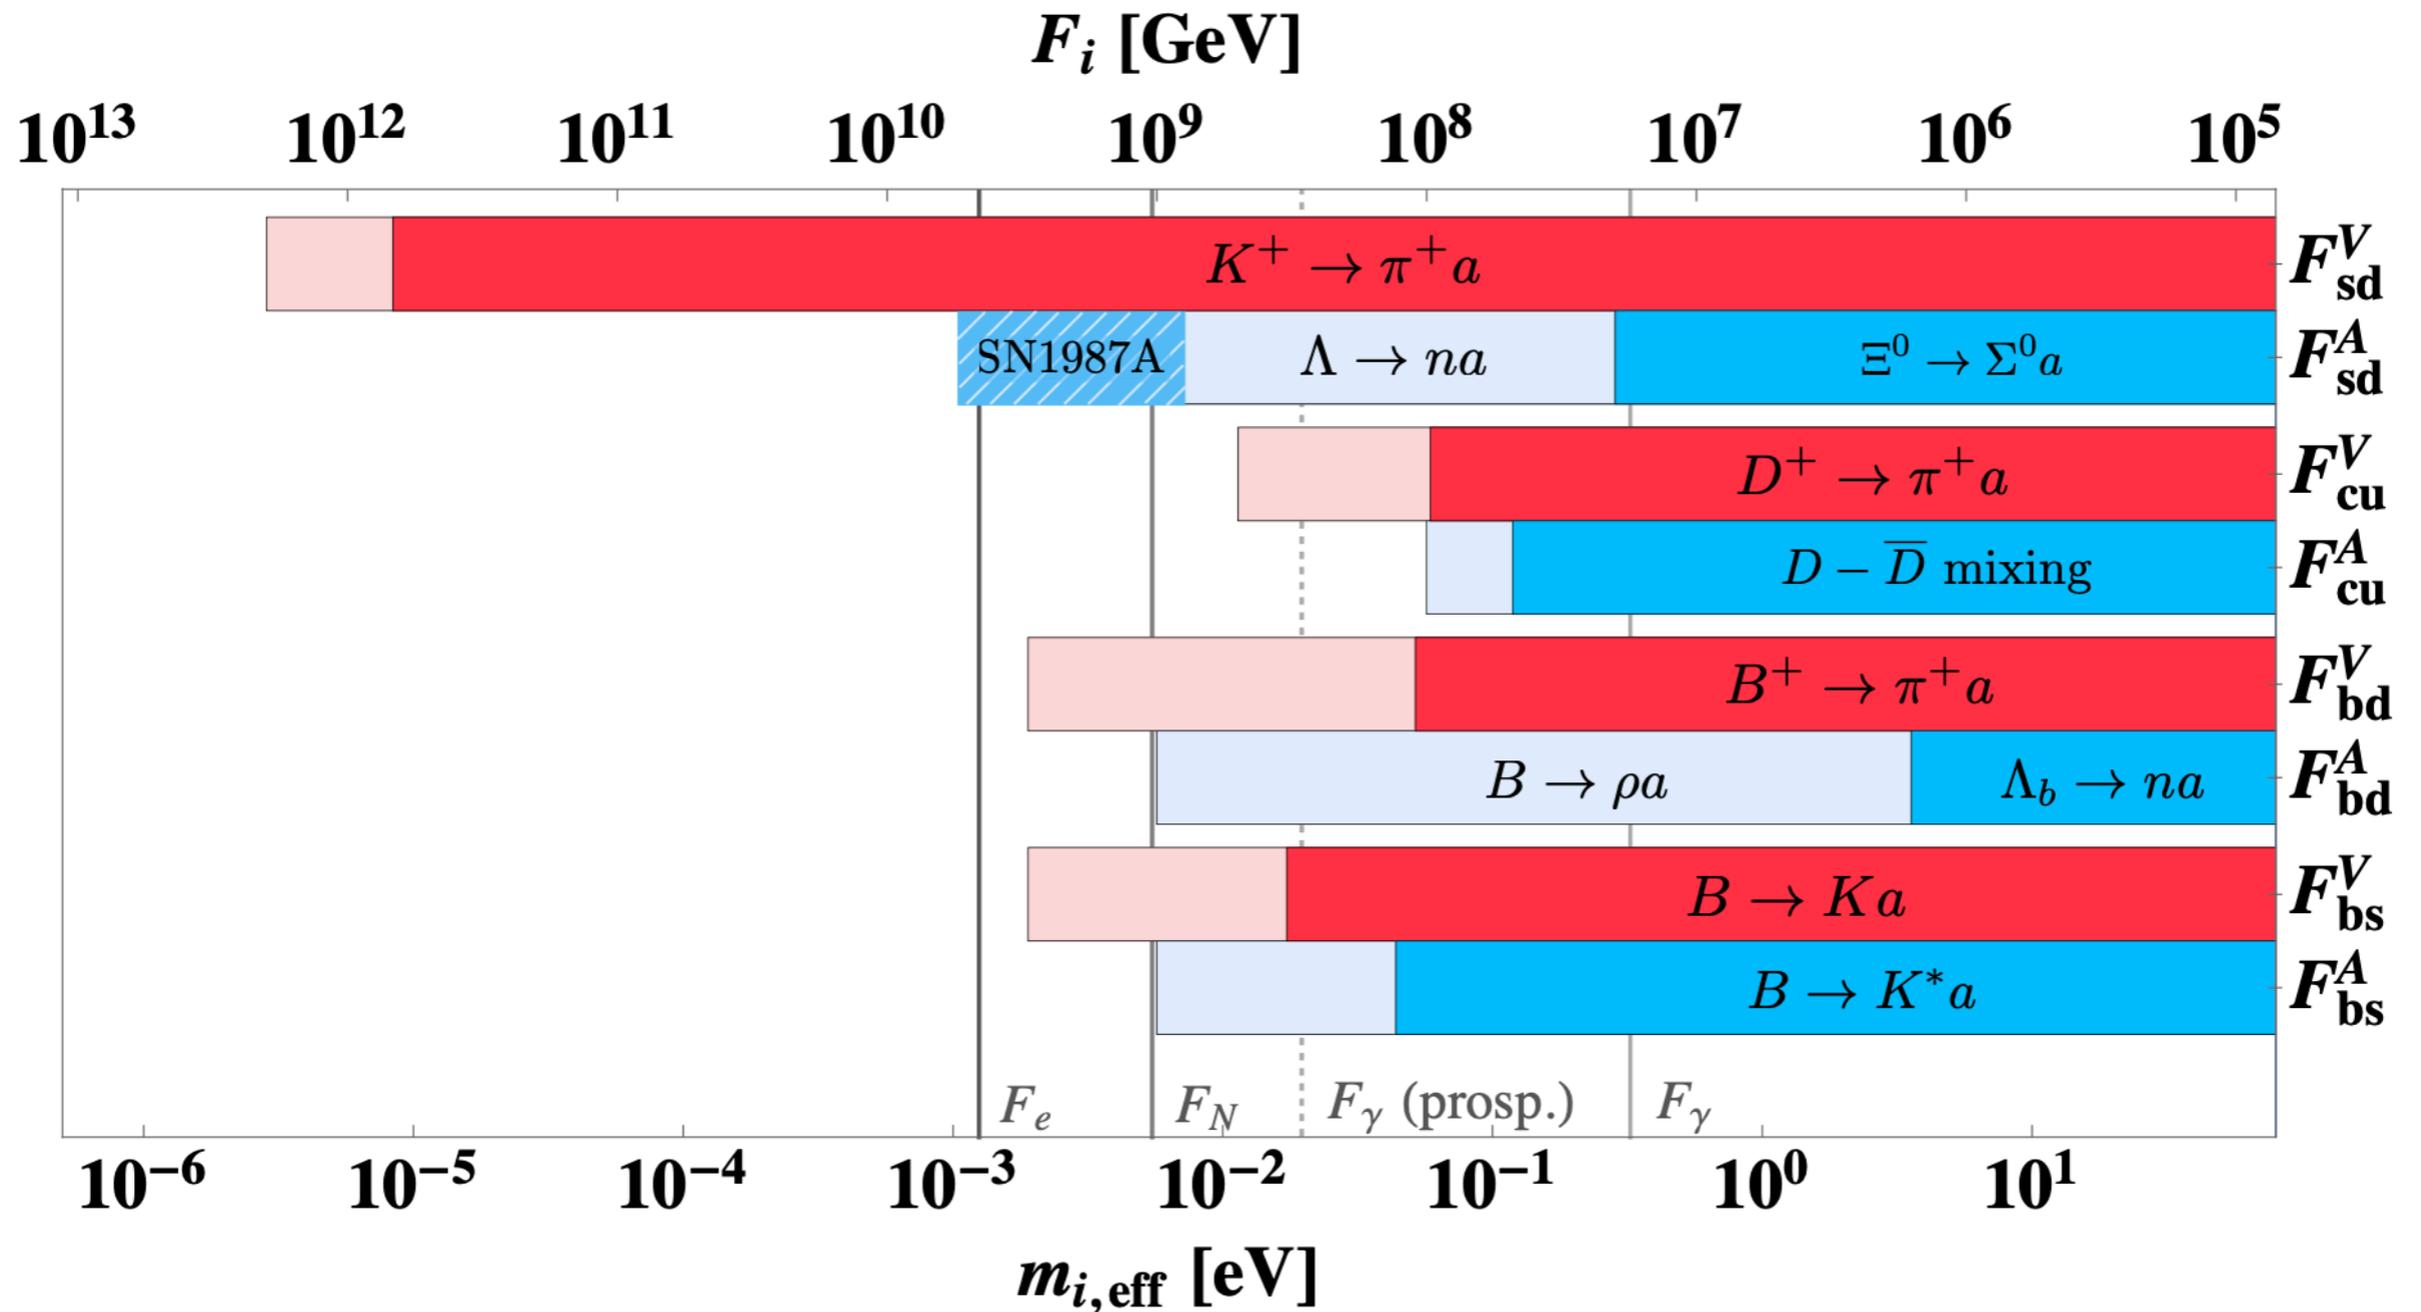

- QCD axion with FV couplings to quarks
 - solves the strong CP problem
 - can be a cold DM candidate
 - effectively massless in FV transitions
- general analysis, allowing for FV couplings as well
 - first focus on quark FV transitions

$$\mathcal{L}_{\text{eff}} = \frac{\alpha_s}{8\pi} \frac{a}{f_a} G\tilde{G} + \frac{E}{N} \frac{\alpha_{\text{em}}}{8\pi} \frac{a}{f_a} F\tilde{F} + \frac{\partial_\mu a}{2f_a} \bar{f}_i \gamma^\mu (C_{f_i f_j}^V + C_{f_i f_j}^A \gamma_5) f_j$$

$$F_{f_i f_j}^{V,A} \equiv \frac{2f_a}{C_{f_i f_j}^{V,A}}$$

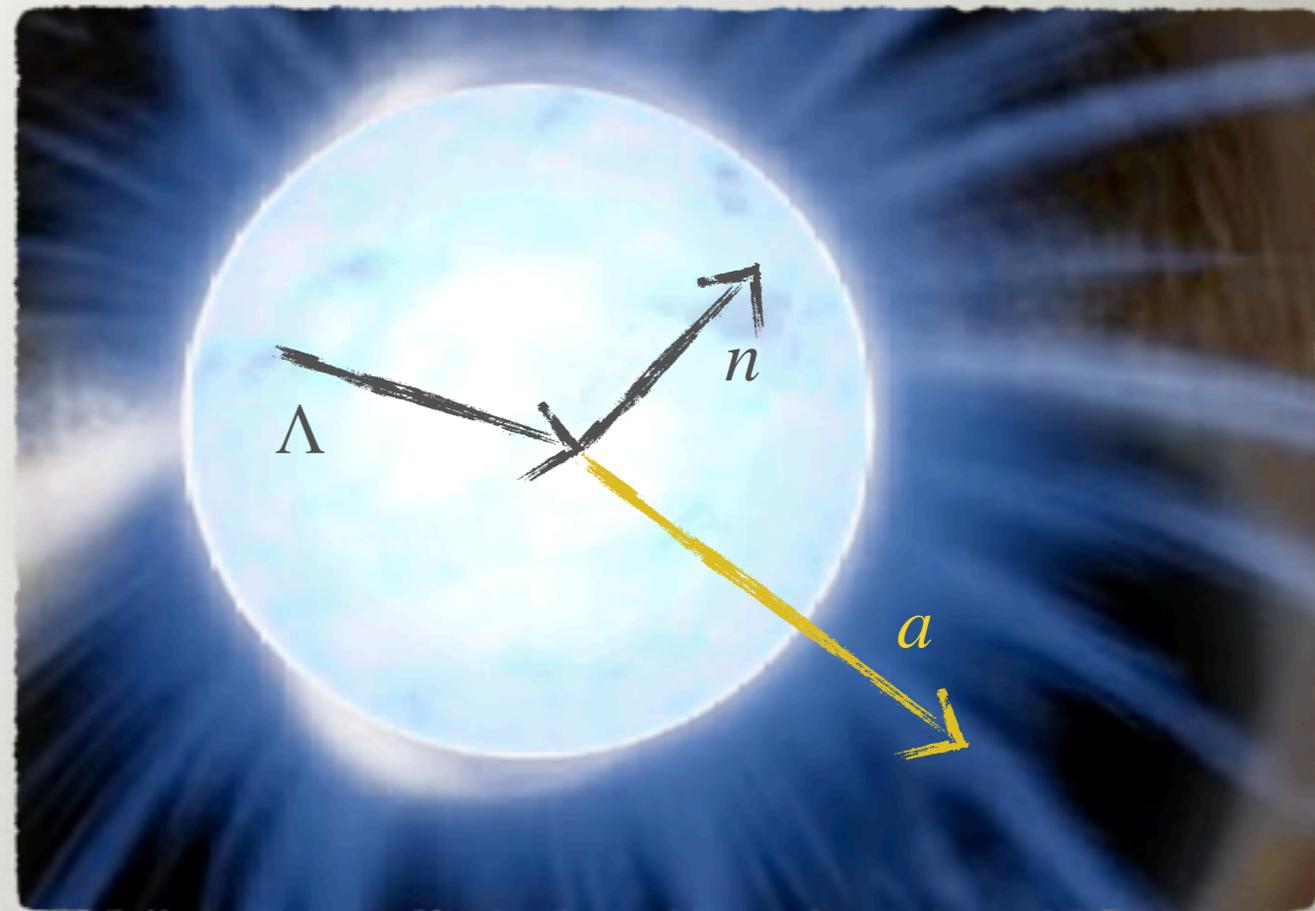

THE STRONGEST FV CONSTRAINTS

Martin Camalich, Pospelov, Vuong, Ziegler, JZ, 2002.04623

SUPERNOVA BOUNDS

- in neutron star Λ , n , p , e are in equilibrium
- $\Lambda \rightarrow na$ decays can cool the proto-neutron star
- Λ , n have the same Fermi energy \Rightarrow at $T=0$ Pauli blocking forbids $\Lambda \rightarrow na$ decays
- at finite temperature volume emission rate (in NR limit)

$$Q \simeq n_n (m_\Lambda - m_n) \Gamma(\Lambda \rightarrow na) e^{-\frac{m_\Lambda - m_n}{T}},$$

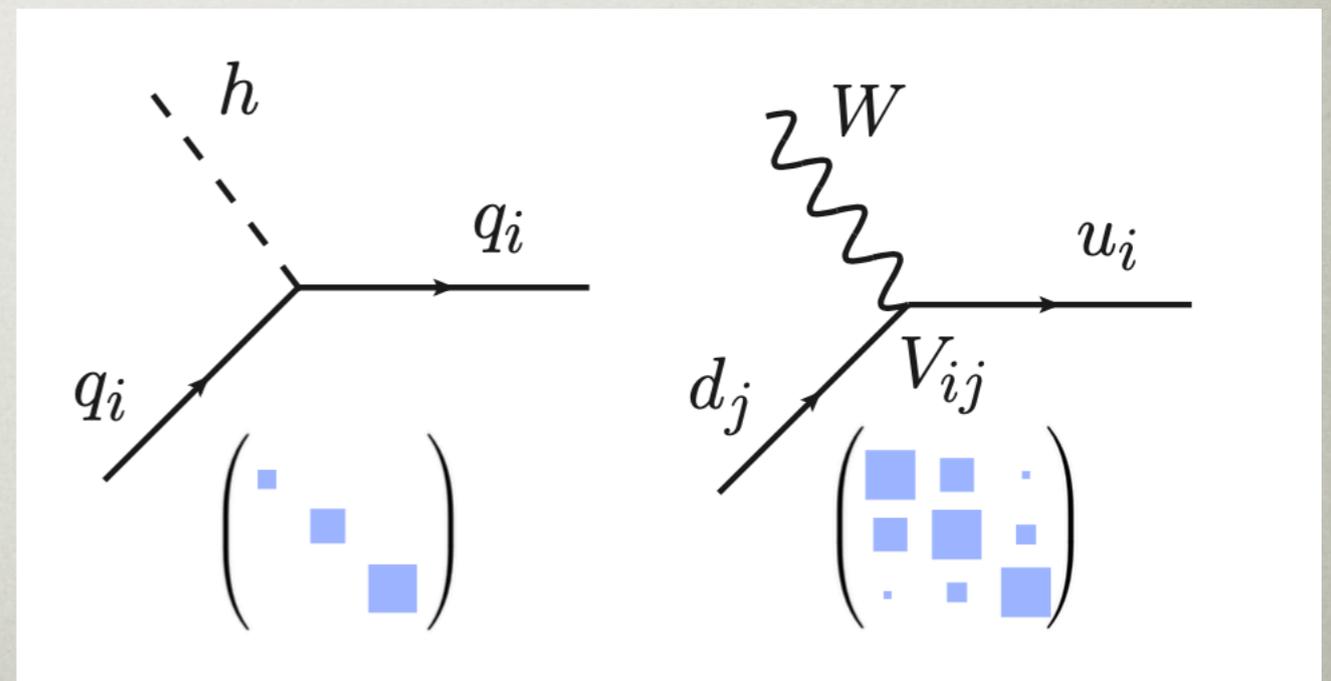

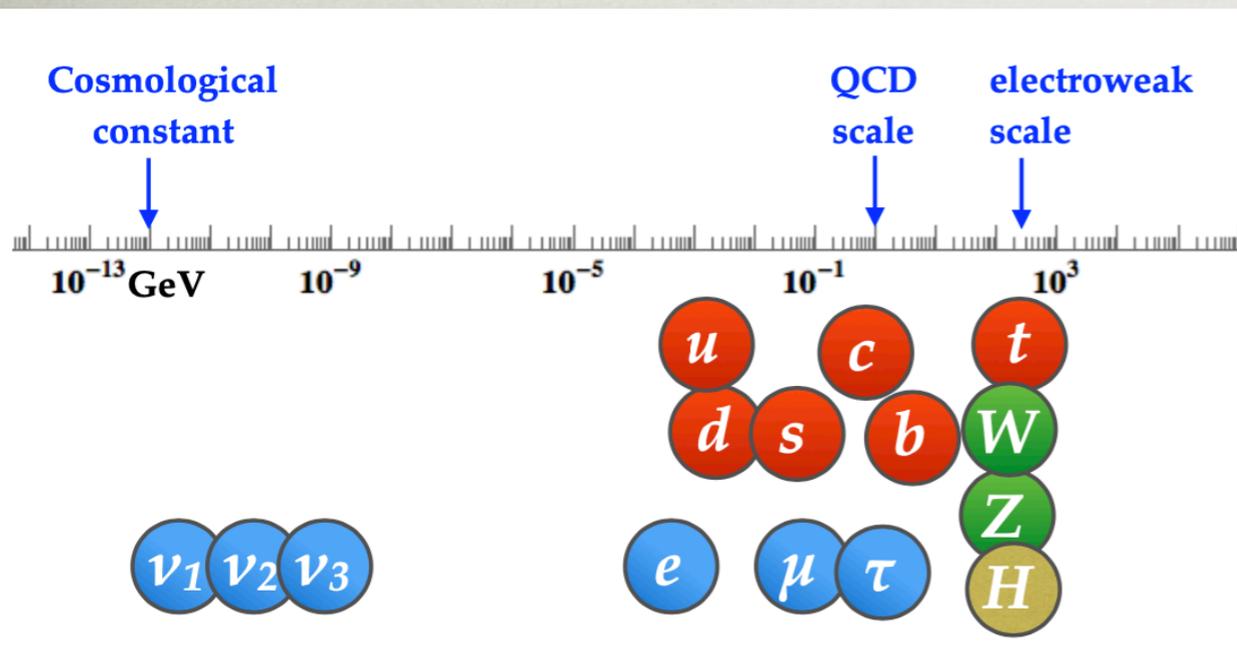

see also Camalich et al, 2012.11632

- assuming this is below neutrino emission rate 1sec after the collapse of SN1987A
 - bounds on $|F_{sd}^A|$ and $|F_{sd}^V|$ in the range $10^9 - 10^{10}$ GeV

AXIFLAVON

STANDARD MODEL FLAVOR PUZZLE

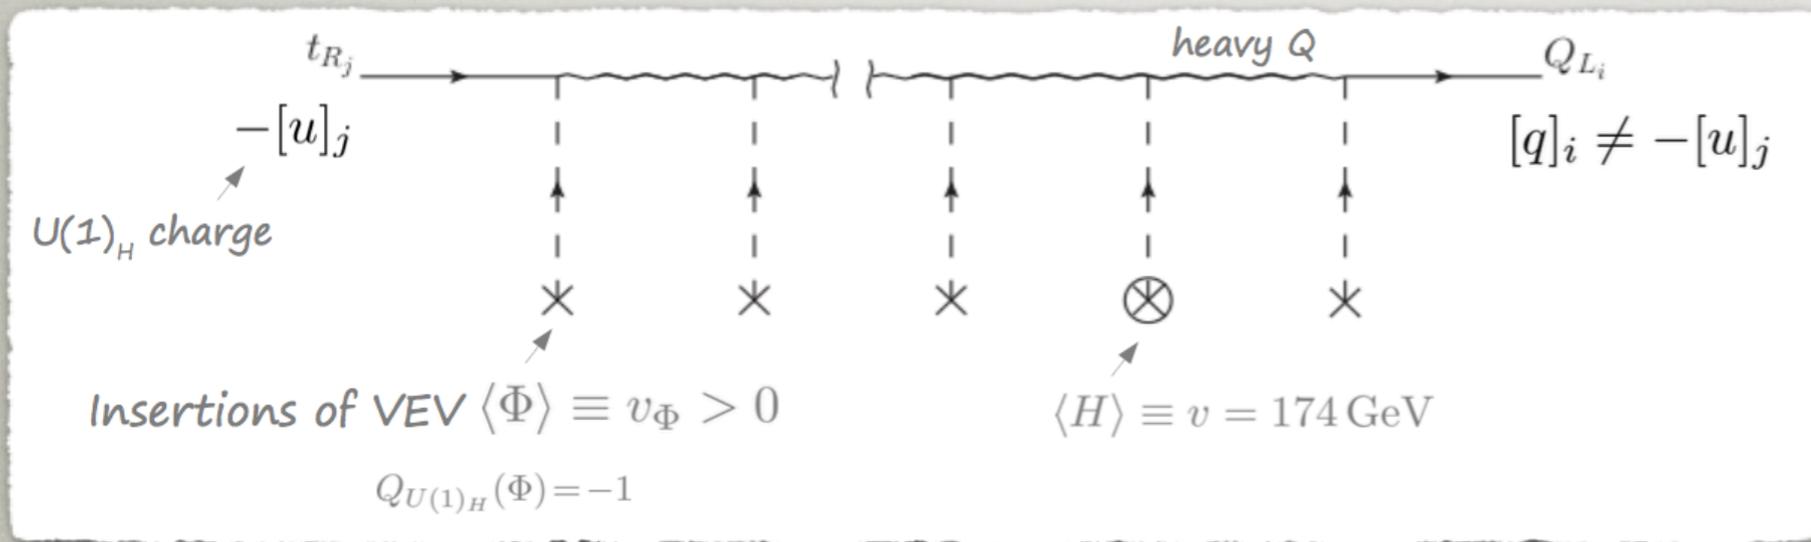

- are flavor violating couplings of QCD axion motivated?
- could be related to the solution of the standard model flavor puzzle
 - why SM fermion masses so hierarchical?
 - why CKM matrix hierarchical, any pattern in PMNS?

AXIFLAVON

- flavor symmetries that explain Yukawa hierarchies have a QCD anomaly
 - example FN models of flavor

Froggatt, Nielsen, NPB 147, 277 (1979),...

$$\mathcal{L}_{eff} \sim \left(\frac{\phi}{\Lambda_F} \right)^{x_{ij}} h \bar{q}_i u_j$$

$$\epsilon \equiv \frac{\phi}{\Lambda_F}$$

- axiflavor mechanism: identify PQ symmetry with FN $U(1)_H$
 - the phase of the flavon is the QCD axion = axiflavor

$$\Phi = \frac{f + \phi(x)}{\sqrt{2}} e^{i a(x) / f}$$

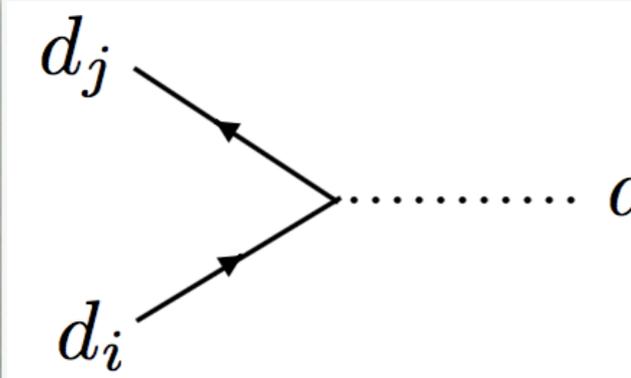

Wilczek, PRL 49, 1549 (1982)

Calibbi, Goertz, Redigolo, Ziegler, JZ, 1612.08040

Ema, Hamaguchi, Moroi, Nakayama, 1612.05492

SEARCHING FOR AXIONS/ AXIFLAVONS

- axion searches use
 - couplings to photons (haloscopes, helioscopes,...)
 - couplings to gluons (CASPEr)
 - flavor diagonal couplings to electrons, nucleons (astrophysical bounds)
- axiflavor
 - in addition flavor violating couplings to fermions
 - in the minimal FN axiflavor model

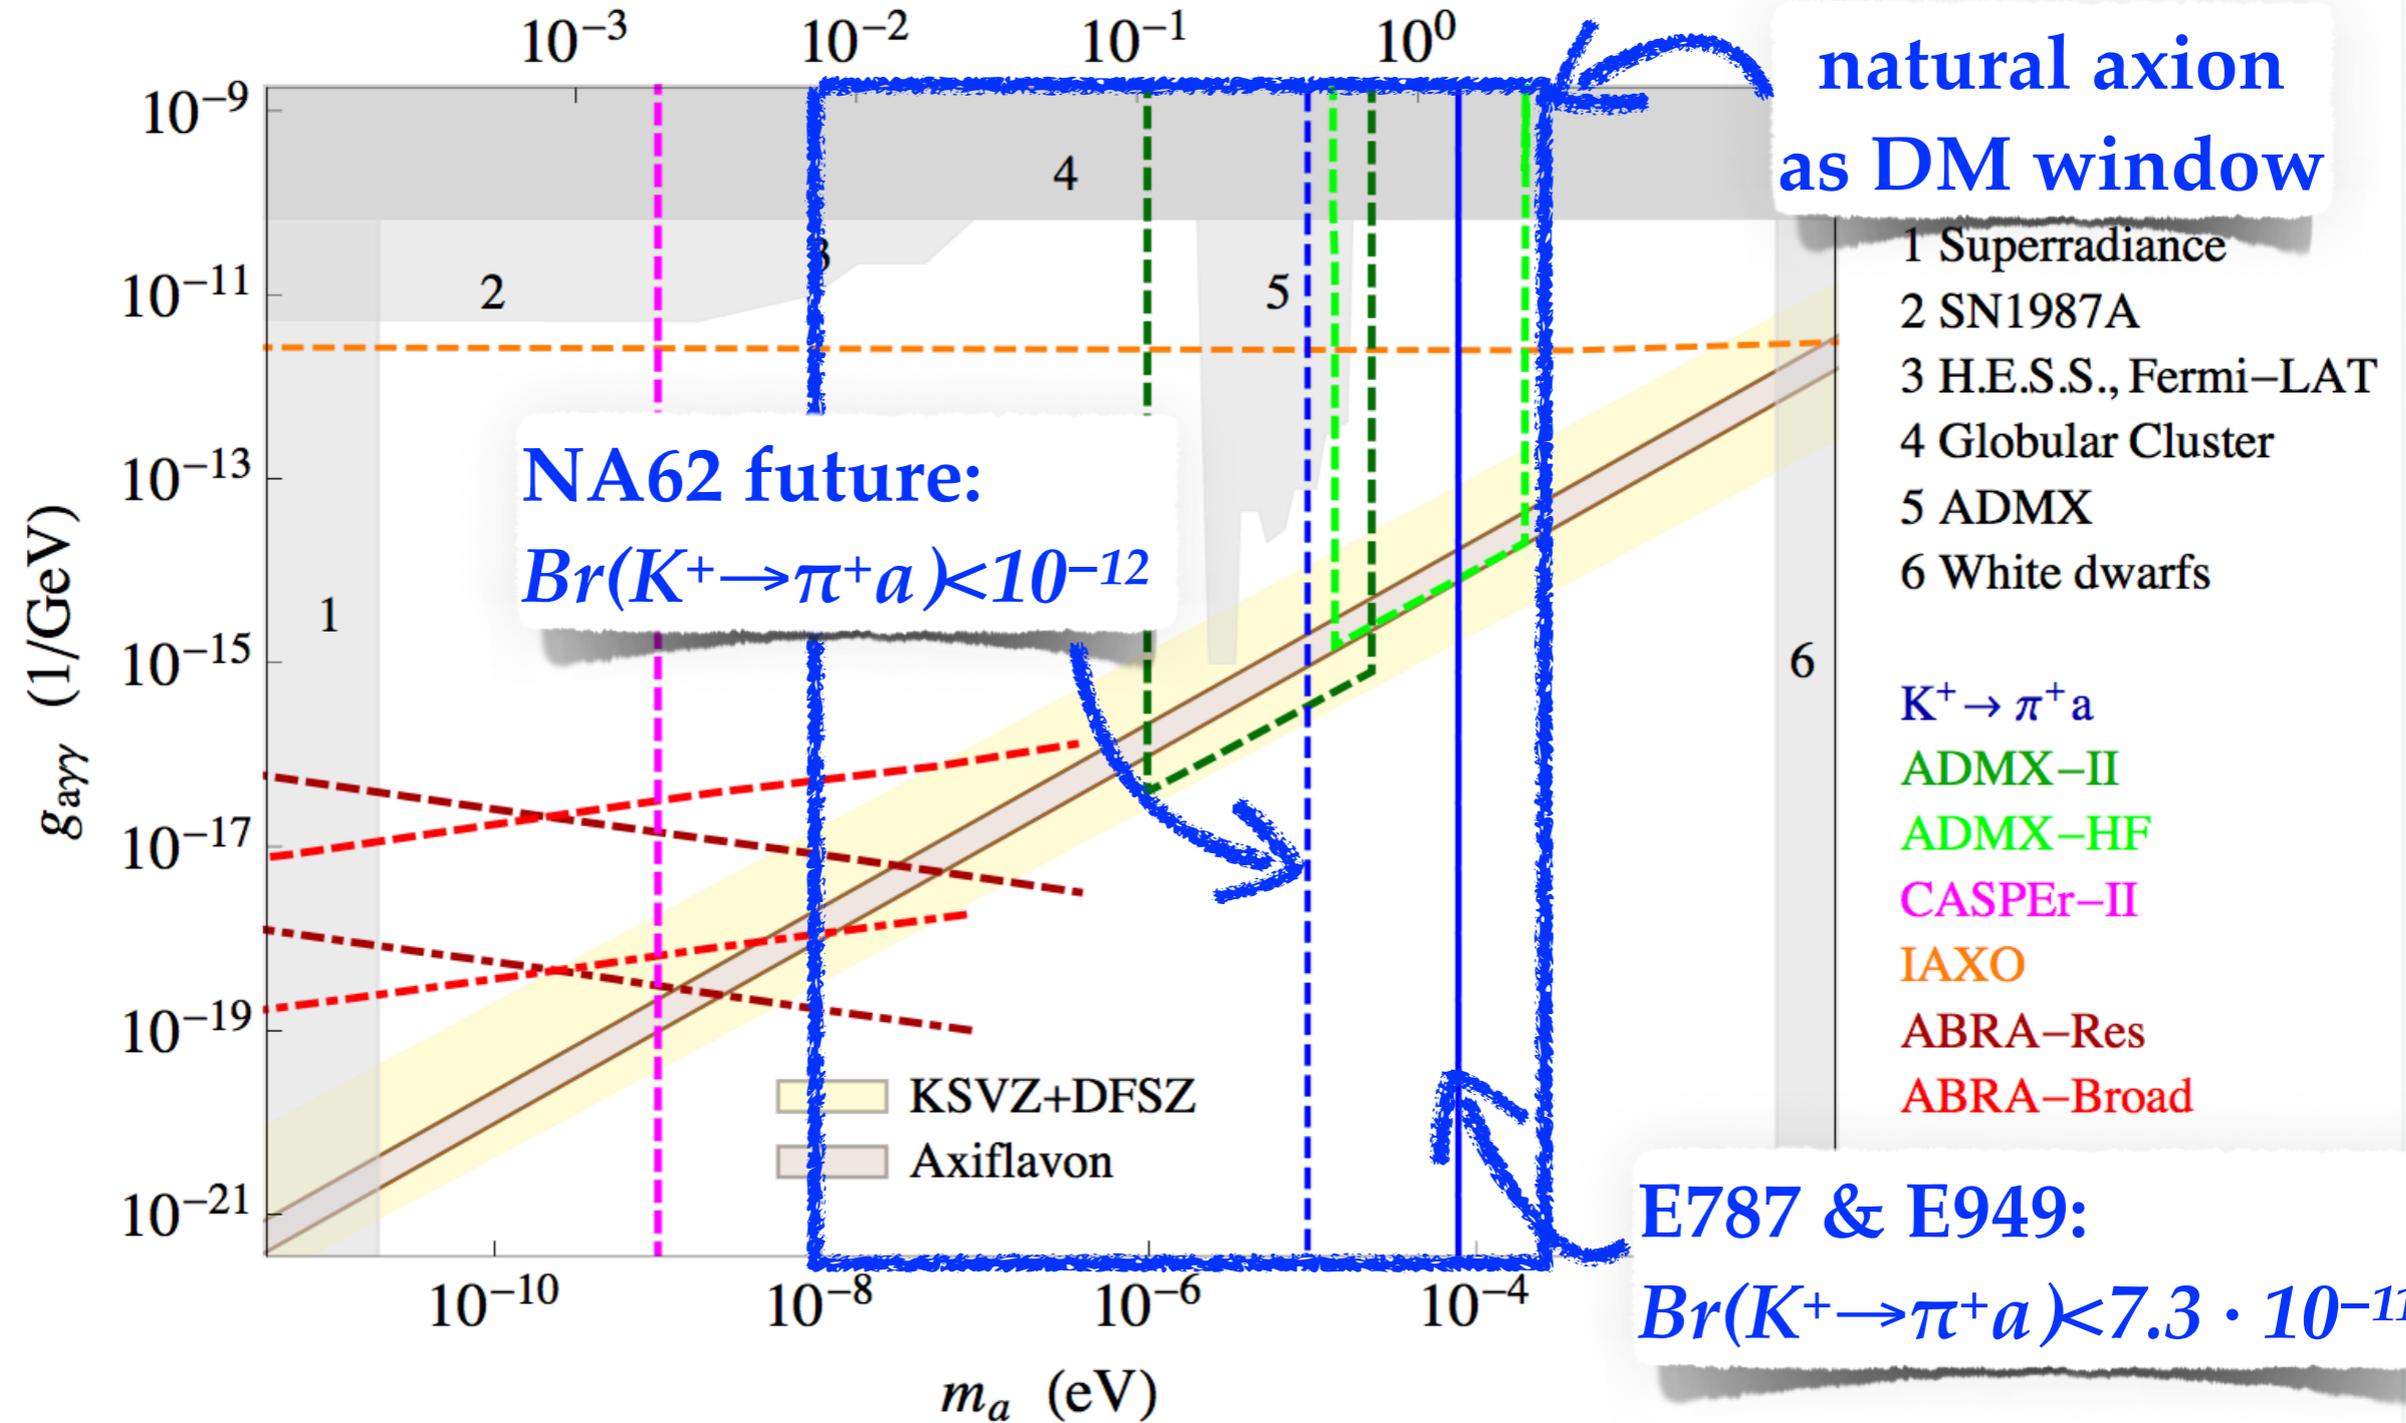

$$d_j \quad d_i \quad \dots \quad a \quad \sim \frac{\sqrt{m_i m_j}}{f_a} \quad \sim \frac{m_a}{\mu\text{eV}} \frac{\sqrt{m_i m_j}}{10^{12}\text{GeV}}$$

SEARCHING FOR AXIONS/ AXIFLAVONS

minimal axiflavoron

θ/π

Calibbi, Goertz, Redigolo, Ziegler, JZ, 1612.08040

LEPTON FLAVOR VIOLATING ALPS

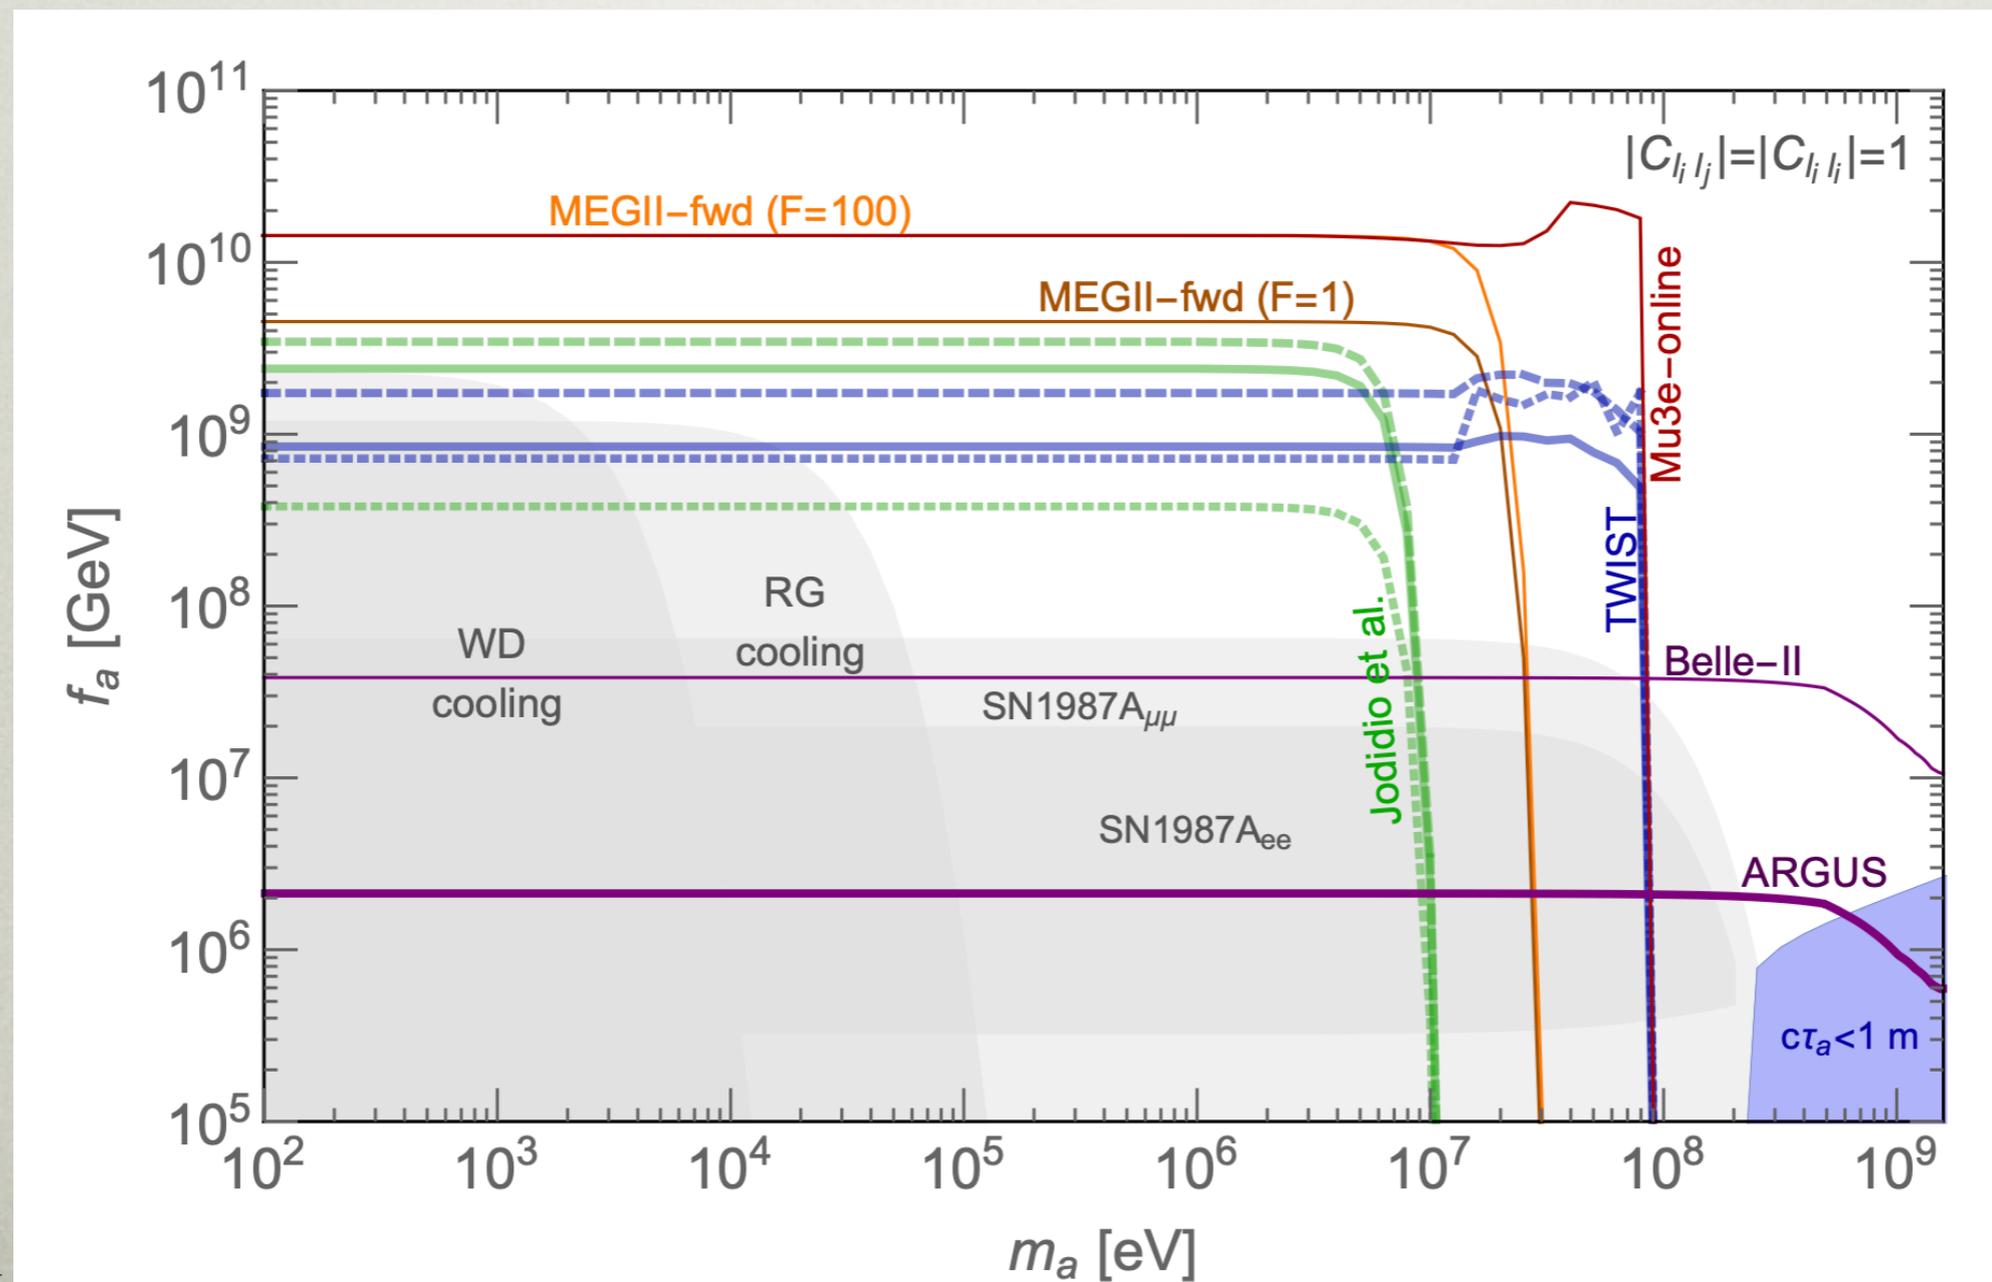

LFV ALPs

Calibbi, Redigolo, Ziegler, JZ, 2006.04795

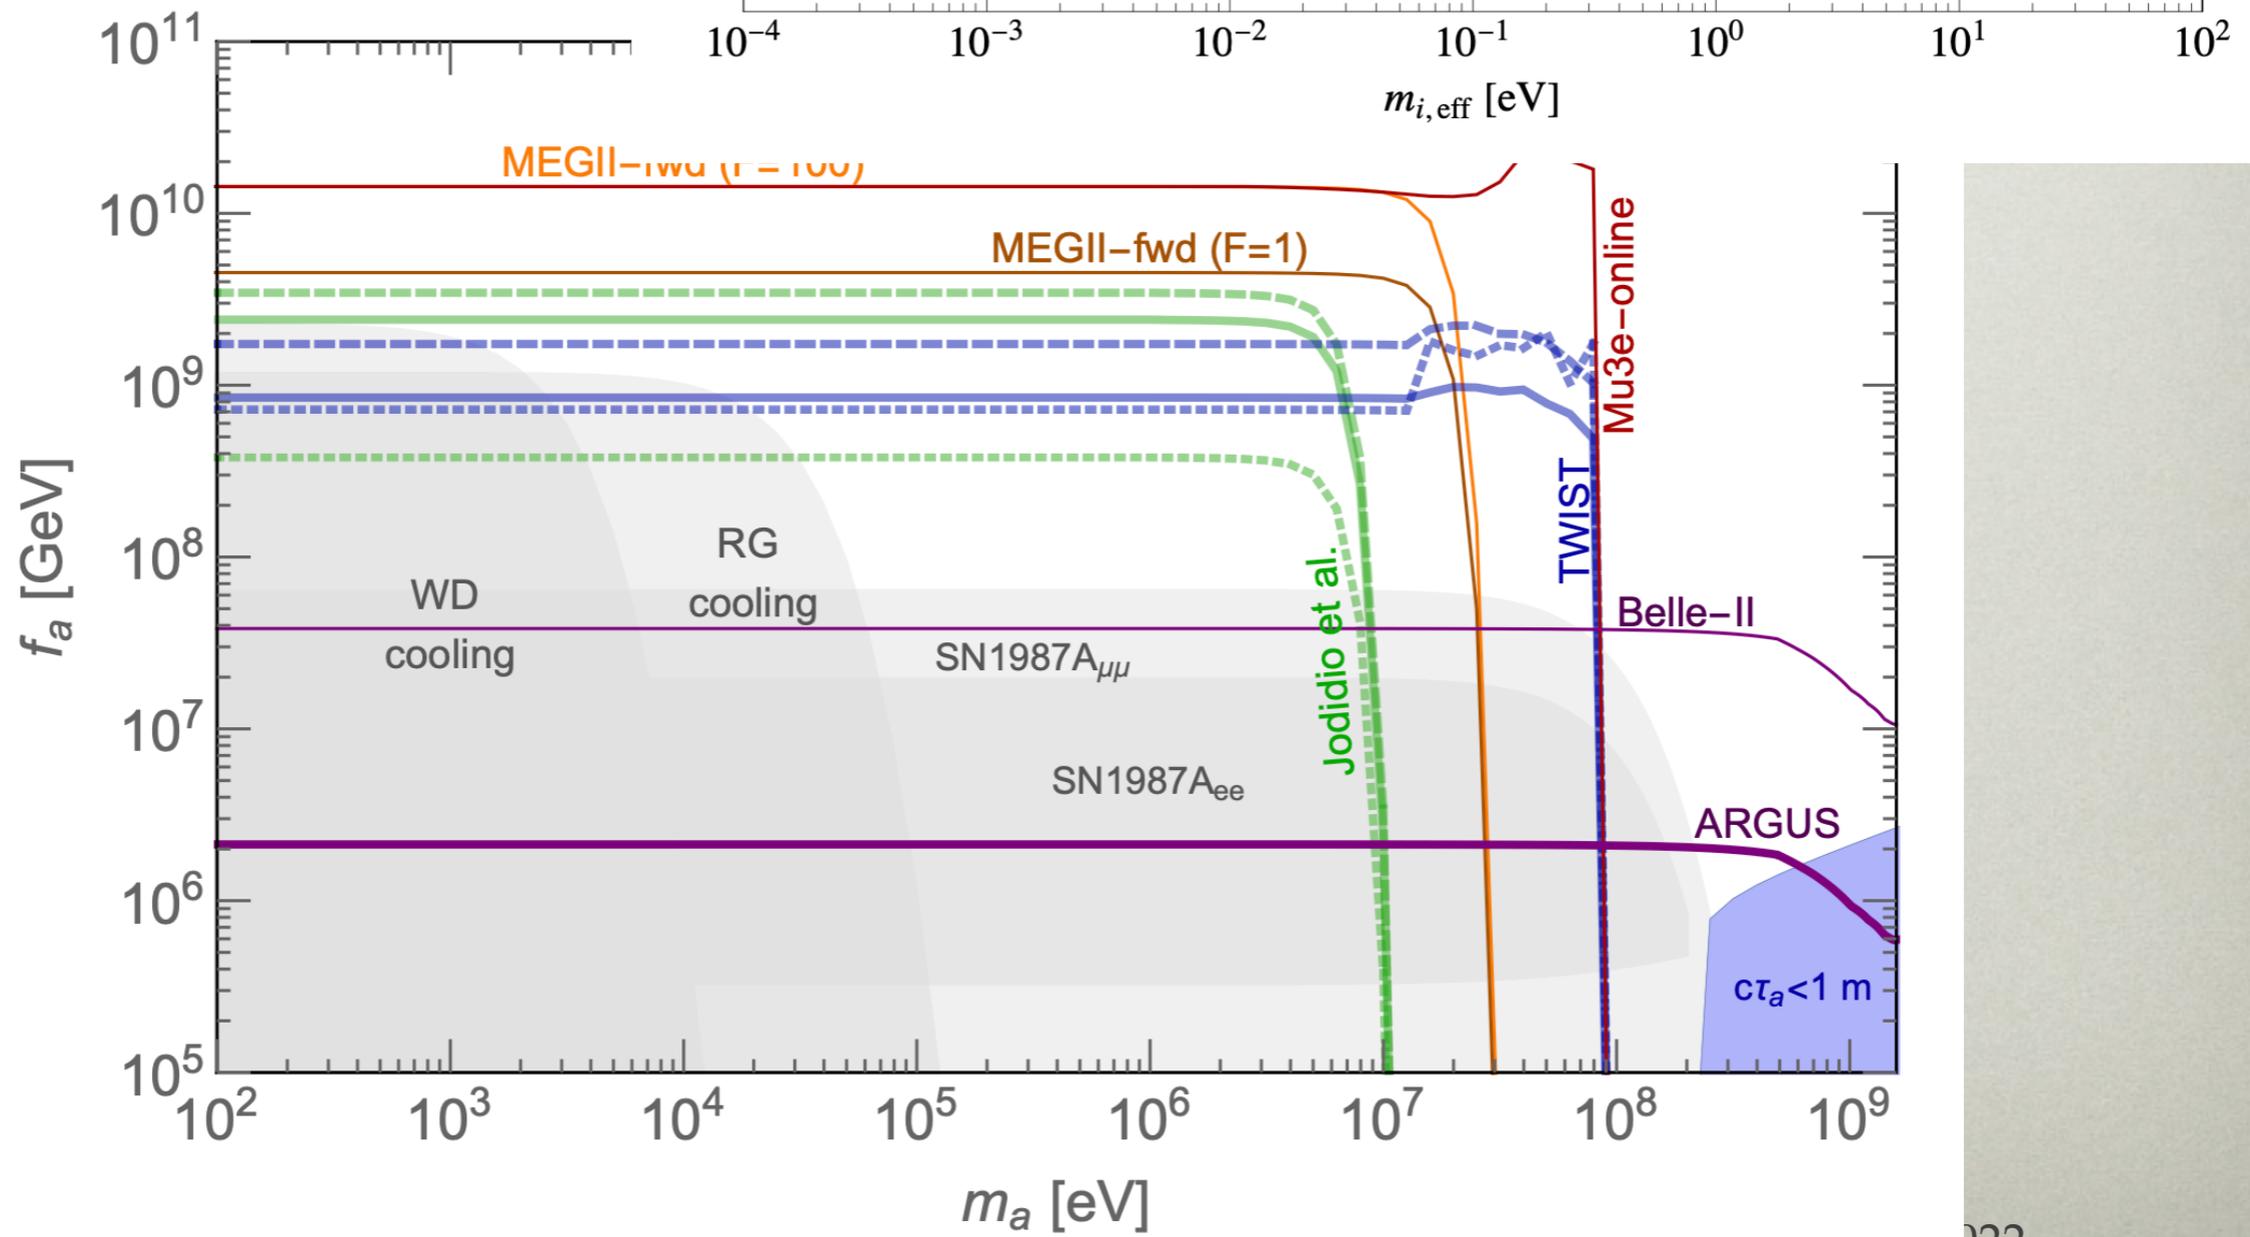

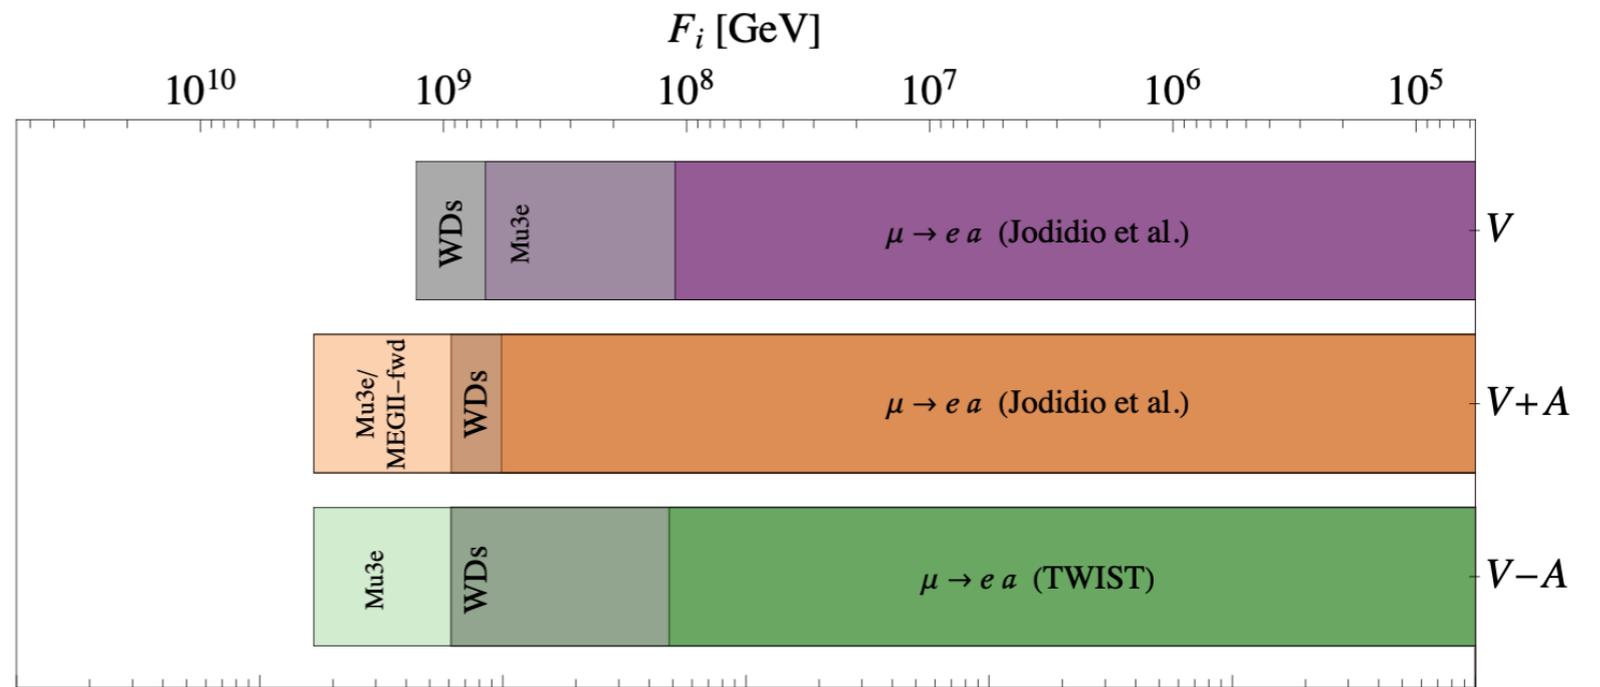

- an example of large, quite untapped, experimental potential
- consider ALP with flavor violating couplings to muons and electrons, $\mu \rightarrow ea$
 - $\mathcal{O}(10^{15} - 10^{17})$ muons available at MEG-II ($\mu \rightarrow e\gamma$), Mu3e ($\mu \rightarrow eee$), Mu2e ($\mu N \rightarrow eN$)
 - compare with present bounds using $2 \times 10^7 \mu$ @ Jodidio et al. (1986), and $6 \times 10^8 \mu$ @ TWIST (2015)

MEGII-FWD

- could repurpose MEG II (\rightarrow MEGII-fwd) [Calibbi, Redigolo, Ziegler, JZ, 2006.04795](#)
- with two weeks of running already very stringent constraints possible

- could repurpose MEGII
- with two weeks of

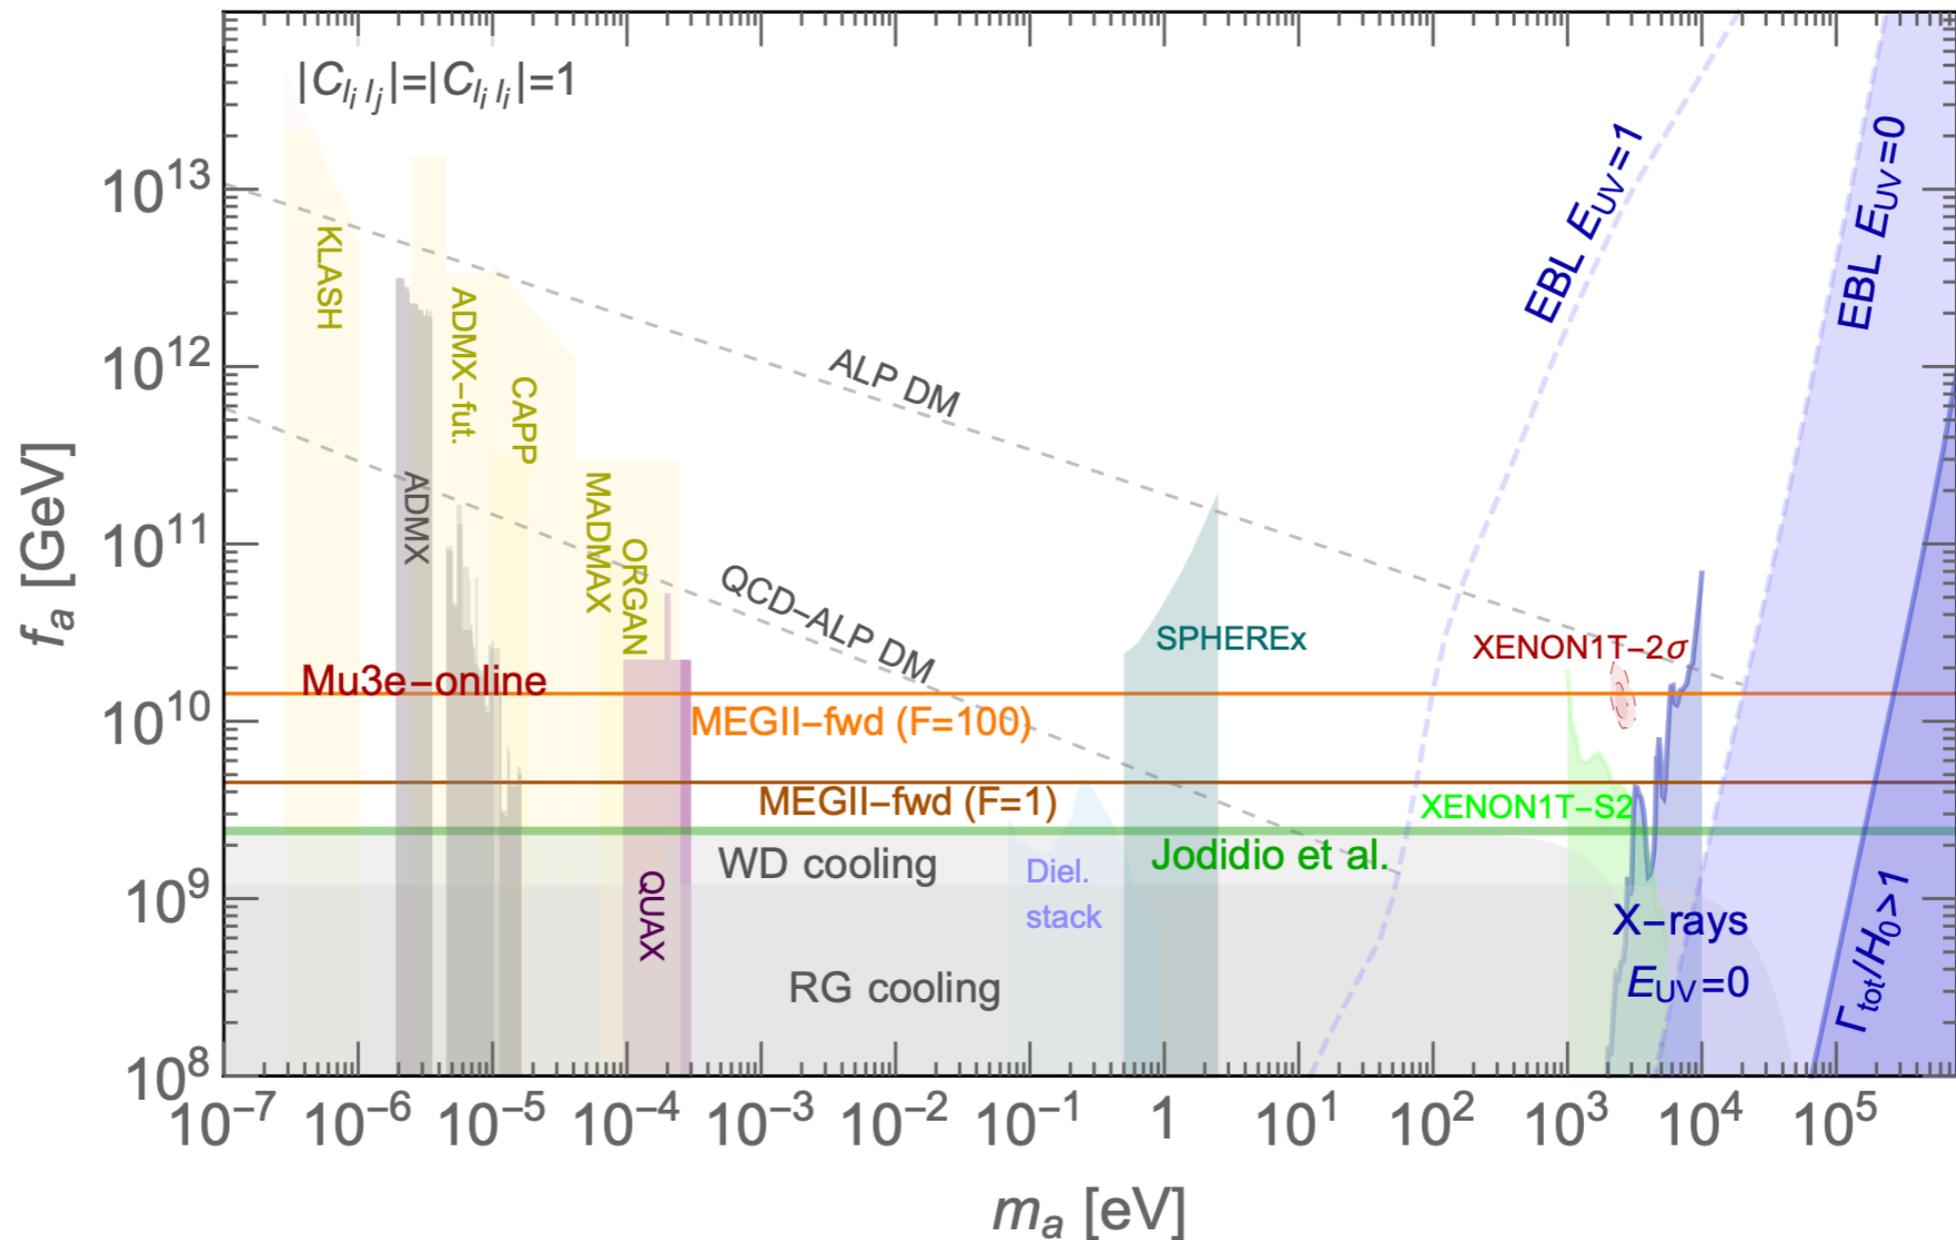

LFV ALP DARK MATTER

- 0-th order condition for ALP to be a DM: be stable on Hubble time
- assume $a \rightarrow \gamma\gamma$ dominates

$$\frac{H_0}{\Gamma_{\text{tot}}} = H_0\tau_a > 1, \quad \text{where} \quad H_0\tau_a \simeq 5.4 \left(\frac{1}{E_{\text{eff}}^2} \right)^2 \left(\frac{10 \text{ keV}}{m_a} \right)^3 \left(\frac{f_a}{10^{10} \text{ GeV}} \right)^2.$$

- if ALP is observed in a LFV process $\Rightarrow m_a \lesssim 10 \text{ keV}$
 - LFV experiments most sensitive for some m_a
 - need other experiments to confirm it is DM

$$\frac{H_0}{\Gamma_{\text{tot}}} =$$

- if ALP is observed in a LFV process $\Rightarrow m_a \lesssim 10 \text{ keV}$
 - LFV experiments most sensitive for some m_a
 - need other experiments to confirm it is DM

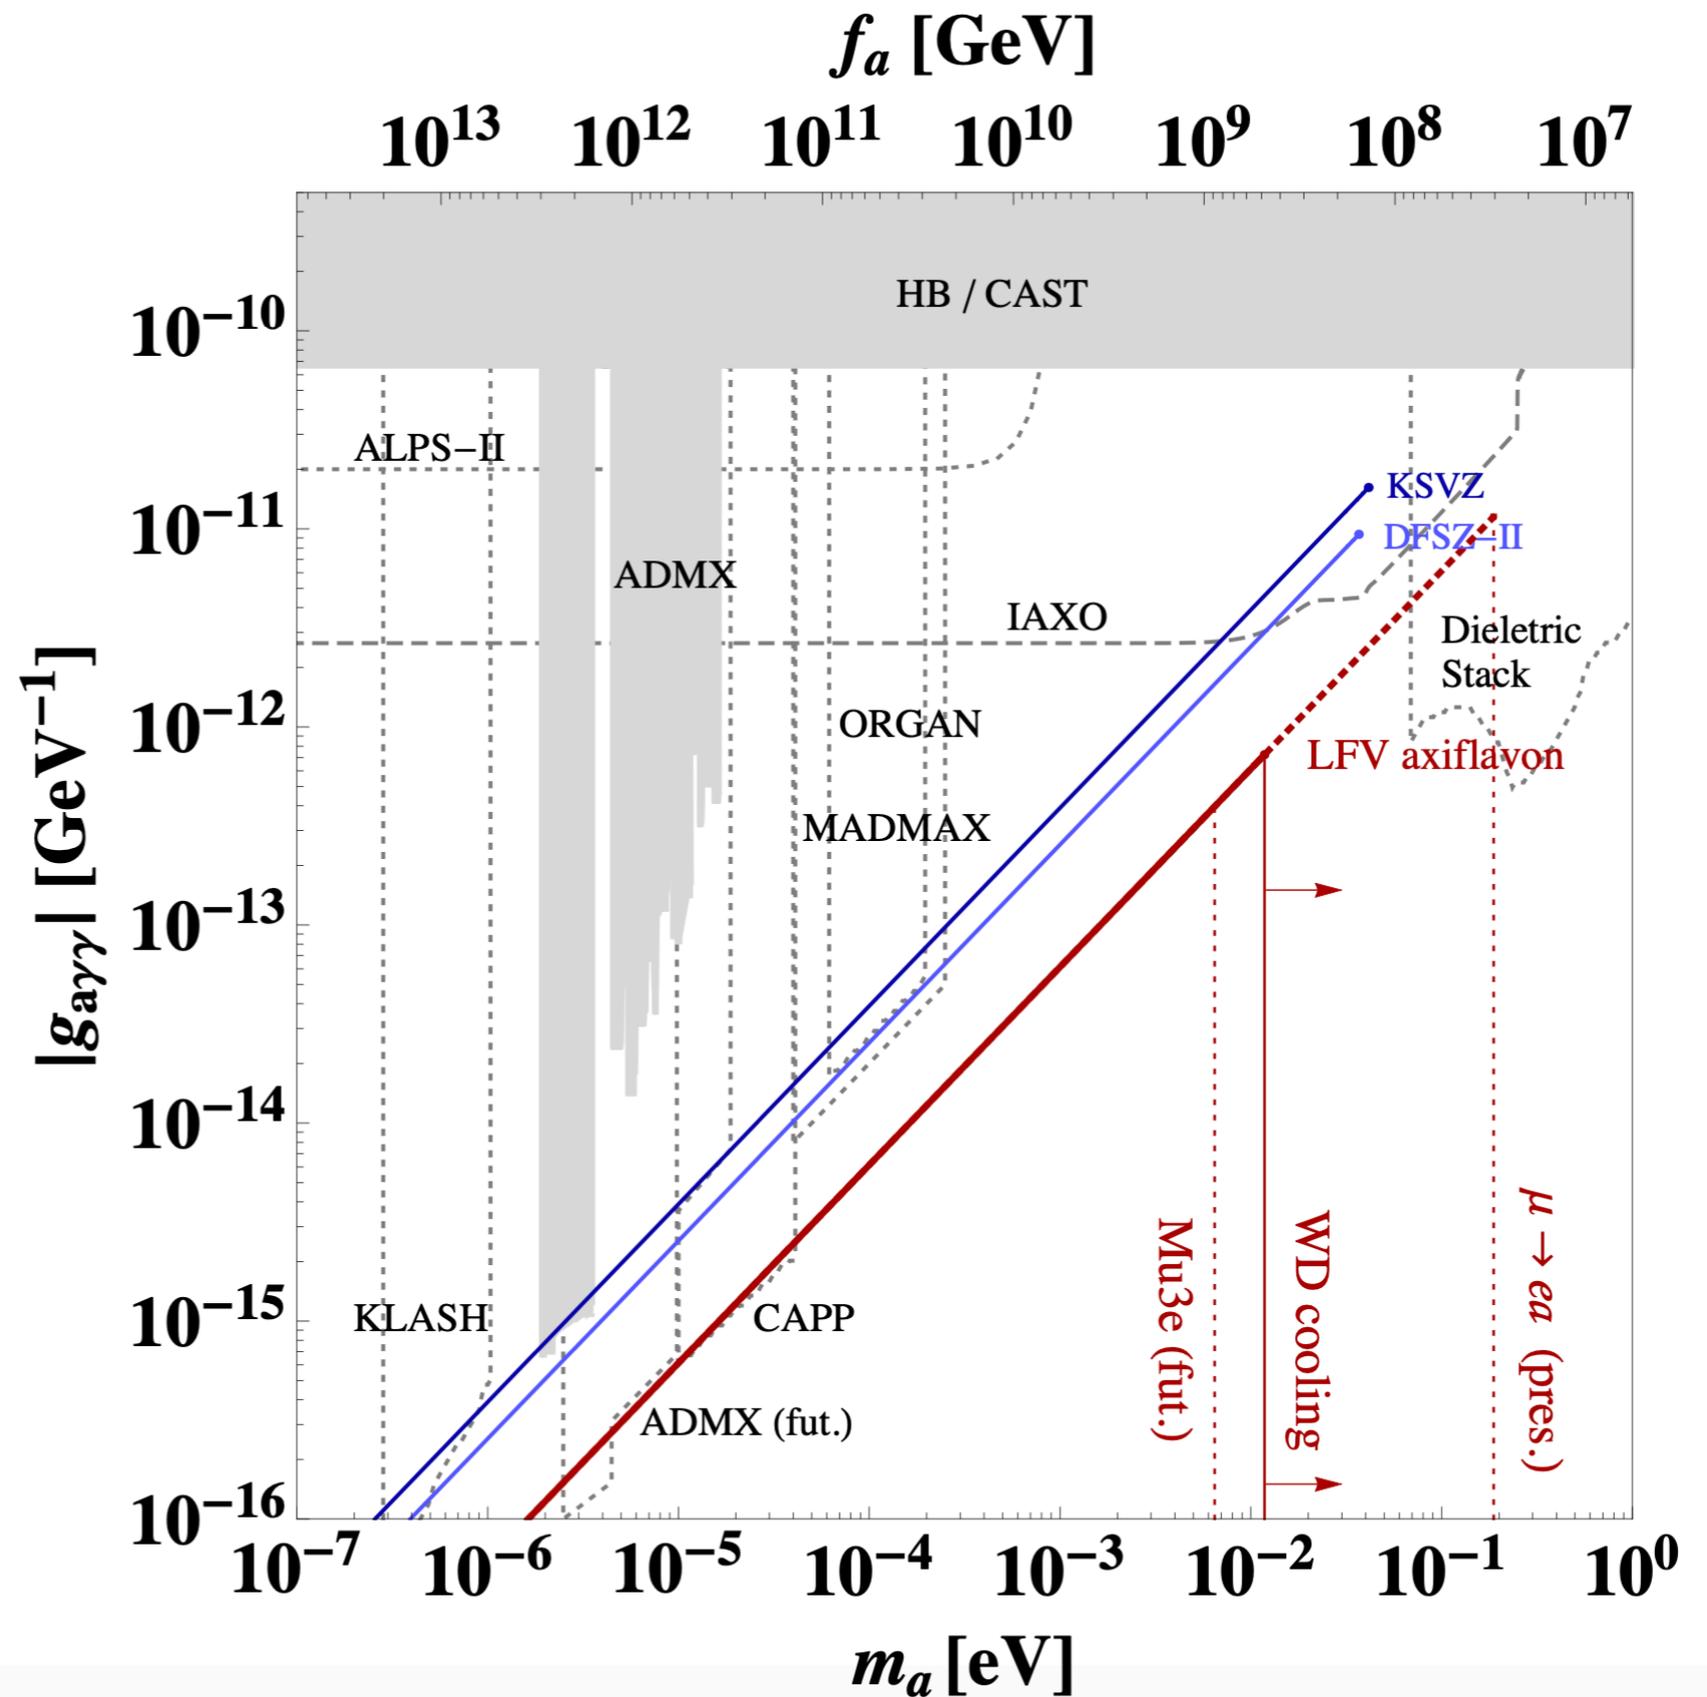

LFV AXIFLAVON

Calibbi, Redigolo, Ziegler, JZ, 2006.04795

see also, Linster, Ziegler, 1805.07341

- the PQ symmetry is part of $SU(2)_F \times U(1)_F$ flavor group
 - all FV couplings need to go through 3rd generation
 - for leptons 1-2 and 1-3 mixings are larger (in LH sector to reproduce PMNS matrix)
- \Rightarrow unlike minimal axiflavoron, $K \rightarrow \pi a$ suppr.
 - the observation mode is $\mu \rightarrow ea$

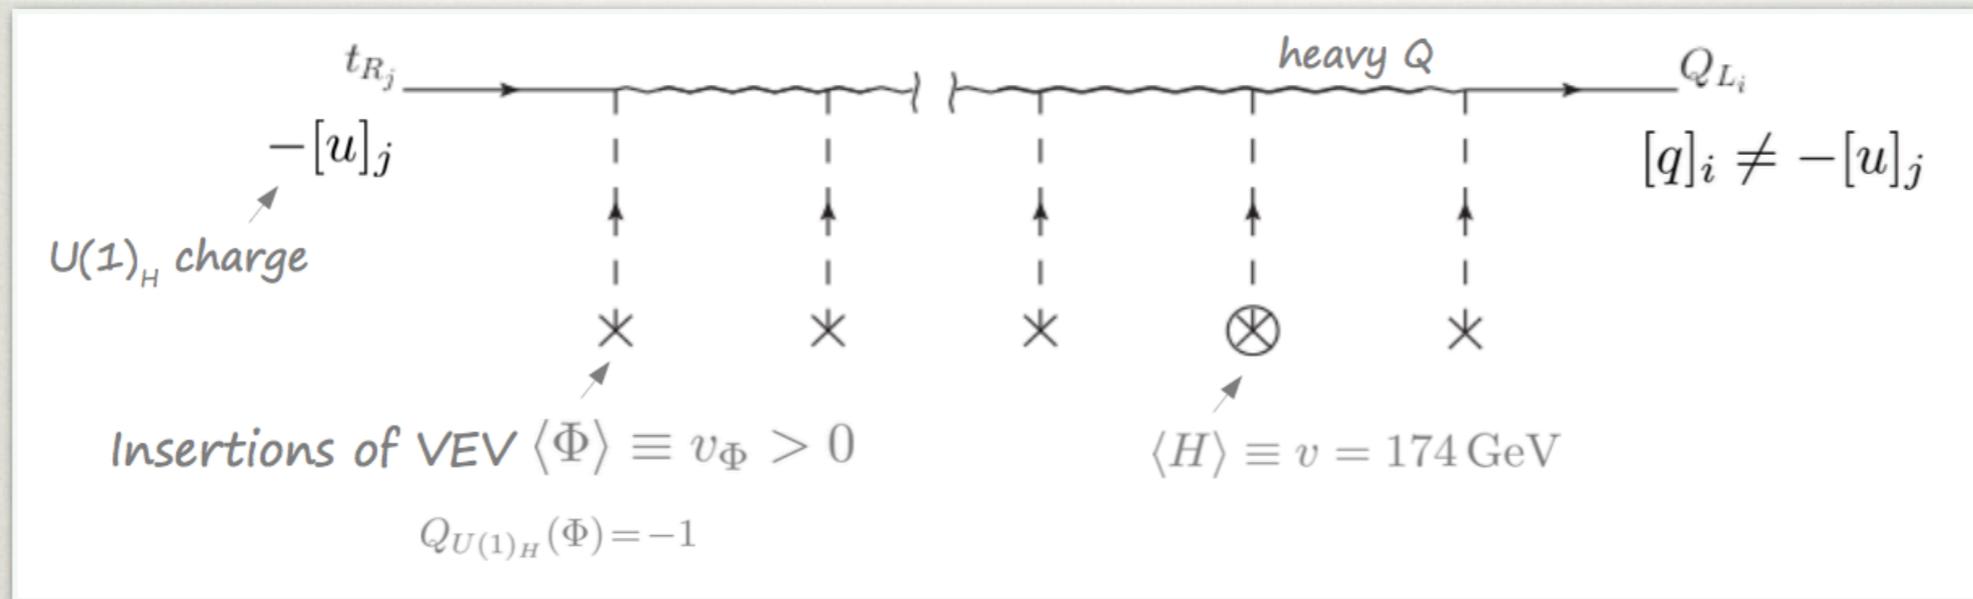

- the PQ s
- flavor g
- all FV
- gener
- for lep
- (in LF
- \Rightarrow unlik
- the ob

341

GAUGED FN MODEL EXAMPLE

ANOMALY FREE FN MODELS

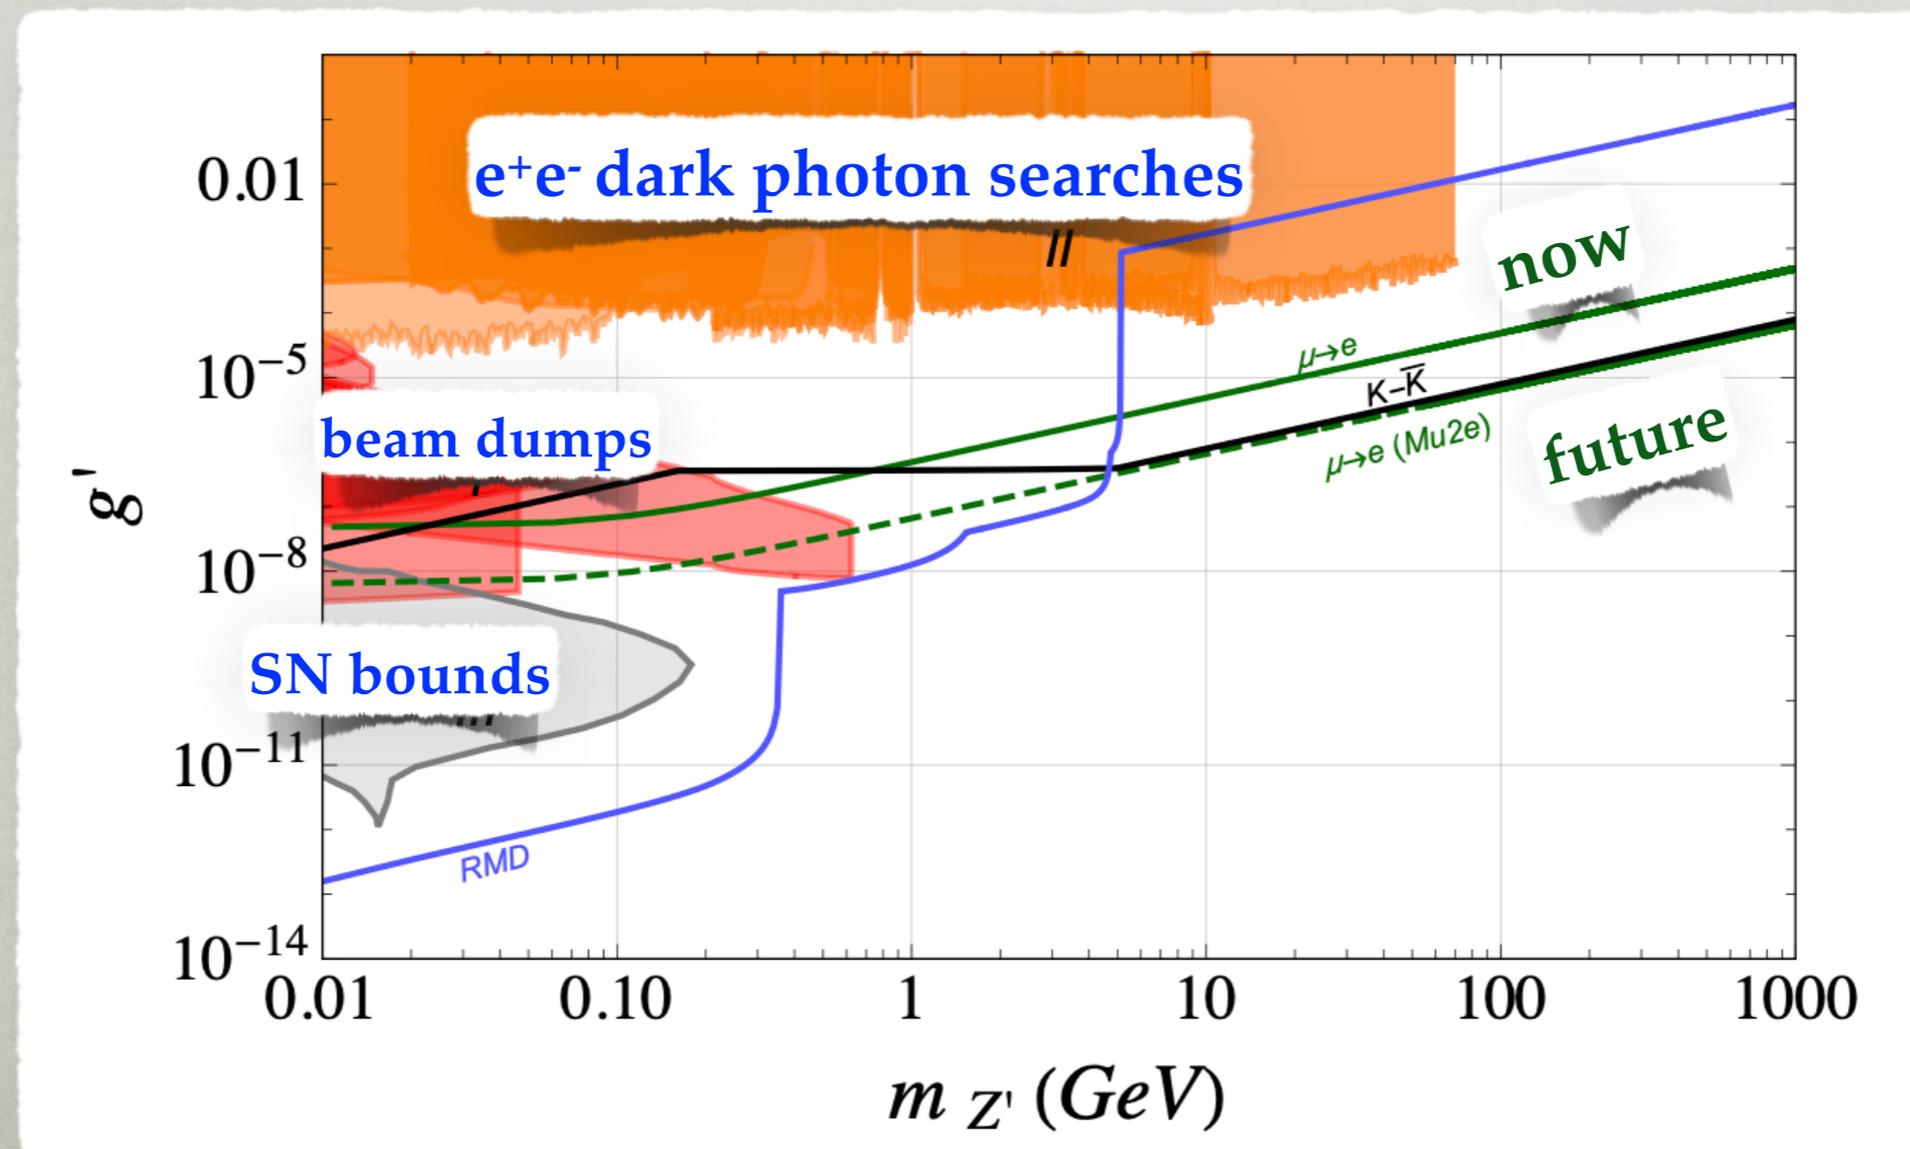

- inverted FN mechanism \Rightarrow non-anomalous $U(1)_{\text{FN}}$
 - vector-like fermions all charged under $U(1)_{\text{FN}}$ (no anomaly)
 - chiral fields not charged under $U(1)_{\text{FN}}$ (in the middle of the chain)
 - a concrete realization of the "clockwork" mechanism
- $U(1)_{\text{FN}}$ can be gauged

EXPERIMENTAL SEARCHES

- how to observe experimentally?
- search in FCNCs
 - $K - \bar{K}, B - \bar{B}$ mixing, etc.
 - exchanges of flavons, heavy vector-like fermions, flavorful Z' s
 - for $\mathcal{O}(1)$ couplings masses $\gtrsim 10^7$ GeV
- for small $U(1)_{\text{FN}}$ gauge couplings Z' can be light
 - can also search for it directly: beam dumps, e^+e^- colliders, astrophysics

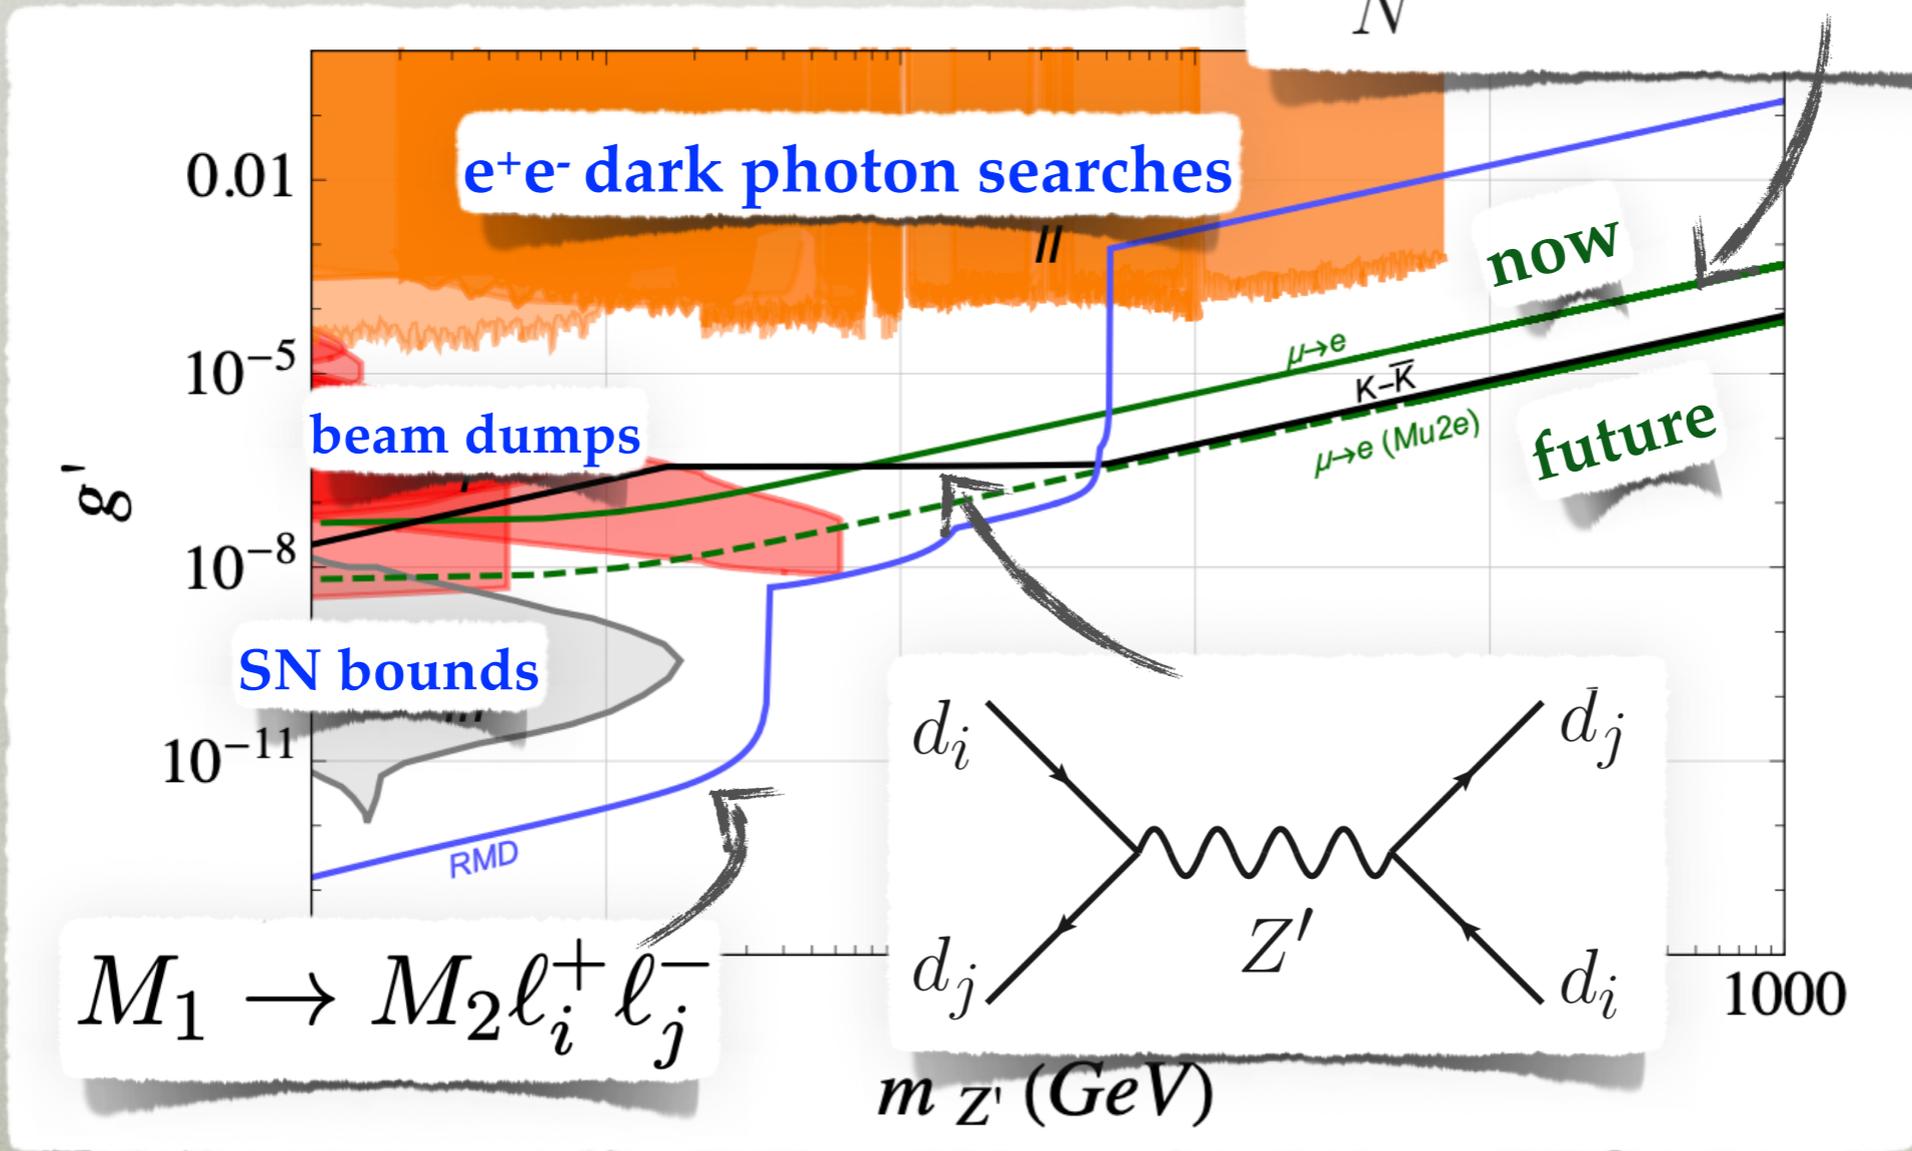

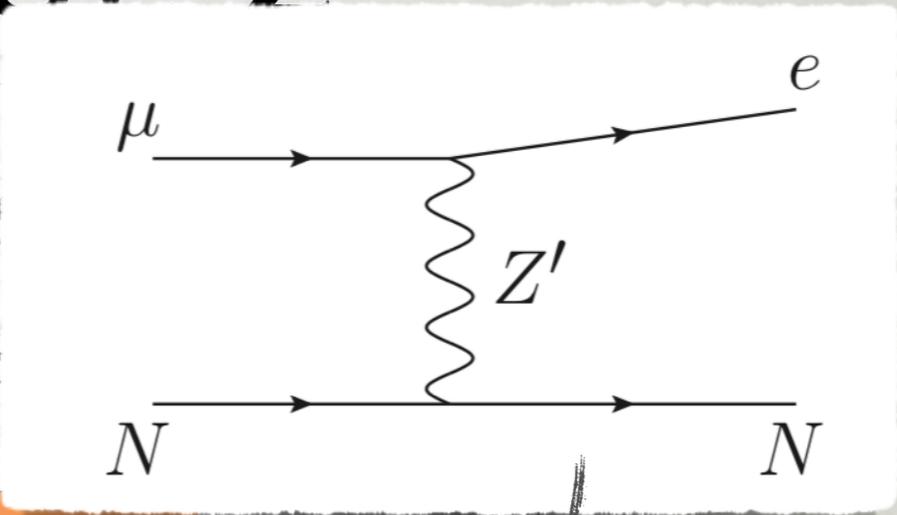

FLAVORFUL Z'

- for $U(1)_{FN}$ benchmark, assuming anarchic neutrino mass from Weinberg op.

FLAVORFULL Z'

- for $U(1)_{FN}$ benchmark, as anarchic neutrino mass

CONCLUDING REMARKS

- FV decays to light new physics give us access to physics at very high scales
- shown several examples
 - could even discover a QCD axion through FV processes

BACKUP SLIDES
